Your calibration folder can contain a mixture of images and binary files. If the calibration folder contains both images and binary files, the toolchain first converts the images to binary files. Once the conversion is complete, it uses the newly generated binary files along with the binary files that were originally in the folder.

### Can I convert the images into binary format first?

Yes. You can convert the images to the binary format with open-source packages such as [OpenCV](#) or [PIL](#). Crop and resize the images so they satisfy the input layer of your trained model.

## Mean and Scale

You can specify mean and scaling pre-processing options to the Amberalla toolchain. These operations are embedded into the network and are applied during inference on each input. Do not provide processed data if you specify the mean or scale. More specifically, do not provide data you have subtracted the mean from or have applied scaling to.

# SageMaker Edge Manager

Amazon SageMaker Edge Manager provides model management for edge devices so you can optimize, secure, monitor, and maintain machine learning models on fleets of edge devices such as smart cameras, robots, personal computers, and mobile devices.

## Why Use Edge Manager?

Many machine learning (ML) use cases require running ML models on a fleet of edge devices, which allows you to get predictions in real-time, preserves the privacy of the end users, and lowers the cost of network connectivity. With the increasing availability of low-power edge hardware designed for ML, it is now possible to run multiple complex neural network models on edge devices.

However, operating ML models on edge devices is challenging, because devices, unlike cloud instances, have limited compute, memory, and connectivity. After the model is deployed, you need to continuously monitor the models, because model drift can cause the quality of model to decay overtime. Monitoring models across your device fleets is difficult because you need to write custom code to collect data samples from your device and recognize skew in predictions. In addition, models are often hard-coded into the application. To update the model, you must rebuild and update the entire application or device firmware, which can disrupt your operations.

With SageMaker Edge Manager, you can optimize, run, monitor, and update machine learning models across fleets of devices at the edge.

## How Does it Work?

At a high level, there are five main components in the SageMaker Edge Manager workflow: compiling models with SageMaker Neo, packaging Neo-compiled models, deploying models to your devices, running models on the SageMaker inference engine (Edge Manager agent), and maintaining models on the devices.

SageMaker Edge Manager uses SageMaker Neo to optimize your models for the target hardware in one click, then to cryptographically sign your models before deployment. Using SageMaker Edge Manager, you can sample model input and output data from edge devices and send it to the cloud for monitoring and analysis, and view a dashboard that tracks and visually reports on the operation of the deployed models within the SageMaker console.

SageMaker Edge Manager extends capabilities that were previously only available in the cloud to the edge, so developers can continuously improve model quality by using Amazon SageMaker Model Monitor for drift detection, then relabel the data with SageMaker Ground Truth and retrain the models in SageMaker.

## How Do I Use SageMaker Edge Manager?

If you are a first time user of SageMaker Edge Manager, we recommend that you do the following:

1. **Read the [Getting Started](#) section** - This section walks you through setting up your first edge packaging job and creating your first fleet.
2. **Explore [Edge Manager Jupyter notebook examples](#)** - Example notebooks are stored in the [amazon-sagemaker-examples](#) GitHub repository in the [sagemaker\\_edge\\_manager](#) folder.

## Getting Started

This guide demonstrates how to complete the necessary steps to register, deploy, and manage a fleet of devices, and how to satisfy Amazon SageMaker Edge Manager prerequisites.

### Topics

- [Setting Up \(p. 2087\)](#)
- [Train, Compile, and Package Your Model \(p. 2090\)](#)
- [Create and Register Fleets and Authenticate Devices \(p. 2092\)](#)
- [Download and Set Up Edge Manager \(p. 2095\)](#)
- [Run Agent \(p. 2098\)](#)

## Setting Up

Before you begin using SageMaker Edge Manager to manage models on your device fleets, you must first create IAM Roles for both SageMaker and Amazon IoT. You will also want to create at least one Amazon S3 bucket where you will store your pre-trained model, the output of your SageMaker Neo compilation job, as well as input data from your edge devices.

### 1. Set up an Amazon account.

Create an Amazon account and an IAM administrator user. For instructions on how to set up your Amazon account, see [How do I create and activate a new Amazon account?](#) For instructions on how to create an administrator user in your Amazon account, see [Creating your first IAM admin user and group.](#)

### 2. Create an IAM role for Amazon SageMaker.

SageMaker Edge Manager needs access to your Amazon S3 bucket URI. To facilitate this, create an IAM role that can run SageMaker and has permission to access Amazon S3. Using this role, SageMaker can run under your account and access to your Amazon S3 bucket.

You can create an IAM role by using the IAM console, Amazon SDK for Python (Boto3), or Amazon CLI. The following is an example of how to create an IAM role and attach the necessary policies with the IAM console.

- a. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
- b. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
- c. For **Select type of trusted entity**, choose **Amazon service**.

- d. Choose the service that you want to allow to assume this role. In this case, choose **SageMaker**. Then choose **Next: Permissions**.
  - This automatically creates an IAM policy that grants access to related services such as Amazon S3, Amazon ECR, and CloudWatch Logs.
- e. Choose **Next: Tags**.
- f. (Optional) Add metadata to the role by attaching tags as key–value pairs. For more information about using tags in IAM, see [Tagging IAM resources](#).
- g. Choose **Next: Review**.
- h. Type in a **Role name**.
- i. If possible, type a role name or role name suffix. Role names must be unique within your Amazon account. They are not distinguished by case. For example, you cannot create roles named both PRODROLE and prodrole. Because other Amazon resources might reference the role, you cannot edit the name of the role after it has been created.
- j. (Optional) For **Role description**, type a description for the new role.
- k. Review the role and then choose **Create role**.

Note the SageMaker Role ARN, which you use to create a compilation job with SageMaker Neo and a packaging job with Edge Manager. To find out the role ARN using the console, do the following:

- i. Go to the IAM console: <https://console.amazonaws.cn/iam/>
- ii. Select **Roles**.
- iii. Search for the role you just created by typing in the name of the role in the search field.
- iv. Select the role.
- v. The role ARN is at the top of the **Summary** page.

### 3. Create an IAM role for Amazon IoT.

The Amazon IoT IAM role you create is used to authorize your thing objects. You also use the IAM role ARN to create and register device fleets with a SageMaker client object.

Configure an IAM role in your Amazon account for the credentials provider to assume on behalf of the devices in your device fleet. Then, attach a policy to authorize your devices to interact with Amazon IoT services.

Create a role for Amazon IoT either programmatically or with the IAM console, similar to what you did when you created a role for SageMaker.

- a. Sign in to the Amazon Web Services Management Console and open the IAM console at <https://console.amazonaws.cn/iam/>.
- b. In the navigation pane of the IAM console, choose **Roles**, and then choose **Create role**.
- c. For **Select type of trusted entity**, choose **Amazon service**.
- d. Choose the service that you want to allow to assume this role. In this case, choose **IoT**. Select **IoT** as the **Use Case**.
- e. Choose **Next: Permissions**.
- f. Choose **Next: Tags**.
- g. (Optional) Add metadata to the role by attaching tags as key–value pairs. For more information about using tags in IAM, see [Tagging IAM resources](#).
- h. Choose **Next: Review**.
- i. Type in a **Role name**. The role name must start with **SageMaker**.
- j. (Optional) For **Role description**, type a description for the new role.
- k. Review the role and then choose **Create role**.

- l. Once the role is created, choose **Roles** in the IAM console. Search for the role you created by typing in role name in the **Search** field.
- m. Choose your role.
- n. Next, choose **Attach Policies**.
- o. Search for `AmazonSageMakerEdgeDeviceFleetPolicy` in the **Search** field. Select `AmazonSageMakerEdgeDeviceFleetPolicy`.
- p. Choose **Attach policy**.
- q. Add the following policy statement to the trust relationship:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Principal": {"Service": "credentials.iot.amazonaws.com"},  
            "Action": "sts:AssumeRole"  
        },  
        {  
            "Effect": "Allow",  
            "Principal": {"Service": "sagemaker.amazonaws.com"},  
            "Action": "sts:AssumeRole"  
        }  
    ]  
}
```

A trust policy is a [JSON policy document](#) in which you define the principals that you trust to assume the role. For more information about trust policies, see [Roles terms and concepts](#).

- r. Note the Amazon IoT role ARN. You use the Amazon IoT Role ARN to create and register the device fleet. To find the IAM role ARN with the console:
  - i. Go to the IAM console: <https://console.amazonaws.cn/iam/>
  - ii. Choose **Roles**.
  - iii. Search for the role you created by typing in the name of the role in the **Search** field.
  - iv. Select the role.
  - v. The role ARN is on the Summary page.

#### 4. Create an Amazon S3 bucket.

SageMaker Neo and Edge Manager access your pre-compiled model and compiled model from an Amazon S3 bucket. Edge Manager also stores sample data from your device fleet in Amazon S3.

- a. Open the Amazon S3 console at <https://console.amazonaws.cn/s3/>.
- b. Choose **Create bucket**.
- c. In **Bucket name**, enter a name for your bucket.
- d. In **Region**, choose the Amazon Region where you want the bucket to reside.
- e. In **Bucket settings for Block Public Access**, choose the settings that you want to apply to the bucket.
- f. Choose **Create bucket**.

For more information about creating Amazon S3 buckets, see [Getting started with Amazon S3](#).

Store the name of the bucket in the following variable:

```
bucket=<bucket-name>
```

## Train, Compile, and Package Your Model

In this section you will create SageMaker and Amazon IoT client objects, download a pre-trained machine learning model, upload your model to your Amazon S3 bucket, compile your model for your target device with SageMaker Neo, and package your model so that it can be deployed with the Edge Manager agent.

### 1. Import libraries and create client objects.

This tutorial uses the Amazon SDK for Python (Boto3) to create clients to interact with SageMaker, Amazon S3, and Amazon IoT.

Import Boto3, specify your Region, and initialize the client objects you need as shown in the following example:

```
import boto3
import json
import time

AWS_REGION = 'us-west-2'# Specify your Region
bucket = 'edge-manager-demo-bucket'

sagemaker_client = boto3.client('sagemaker', region_name=AWS_REGION)
iot_client = boto3.client('iot', region_name=AWS_REGION)
```

Define variables and assign them the role ARN you created for SageMaker and Amazon IoT as strings:

```
# Replace with the role ARN you created for SageMaker
sagemaker_role_arn = "arn:aws:iam::<account>:role/*"

# Replace with the role ARN you created for Amazon IoT.
# Note: The name must start with 'SageMaker'
iot_role_arn = "arn:aws:iam::<account>:role/SageMaker*"
```

### 2. Train a machine learning model.

See [Train a Model with Amazon SageMaker](#) for more information on how to train a machine learning model using SageMaker. You can optionally upload your locally trained model directly into an Amazon S3 URI bucket.

If you do not have a model yet, use the curl command to get a local copy of the coco\_ssd\_mobilenet model from TensorFlow's website. The model you just copied is an object detection model trained from the [COCO dataset](#). Type the following into your Jupyter Notebook:

```
model_zip_filename = './coco_ssd_mobilenet_v1_1.0.zip'
!curl http://storage.googleapis.com/download.tensorflow.org/models/tflite/
coco_ssd_mobilenet_v1_1.0_quant_2018_06_29.zip \ --output {model_zip_filename}
```

This particular example was packaged in a .zip file. Unzip this file and repackage it as a compressed TAR file (.tar.gz) before using it in later steps. Type the following into your Jupyter Notebook:

```
# Extract model from zip file
!unzip -u {model_zip_filename}

model_filename = 'detect.tflite'
model_name = model_filename.split('.')[0]

# Compress model into .tar.gz so SageMaker Neo can use it
```

```
model_filename = model_name + '.tar.gz'  
!tar -czf {model_tar} {model_filename}
```

### 3. Upload your model to Amazon S3.

Once you have a machine learning model, store it in an Amazon S3 bucket. The following example uses an Amazon CLI command to upload the model to the Amazon S3 bucket you created earlier in a directory called *models*. Type in the following into your Jupyter Notebook:

```
!aws cp detect.tar.gz s3://{bucket}/models/
```

### 4. Compile your model with SageMaker Neo.

Compile your machine learning model with SageMaker Neo for an edge device. You need to know your Amazon S3 bucket URI where you stored the trained model, the machine learning framework you used to train your model, the shape of your model's input, and your target device.

For the Keras MobileNet V2 model, use the following:

```
framework = 'tflite'  
target_device = 'rasp3b' # Raspberry Pi 3  
data_shape = '{"normalized_input_image_tensor": [1, 300, 300, 3]}'
```

SageMaker Neo requires a specific model input shape and model format based on the deep learning framework you use. For more information about how to save your model, see [What input data shapes does SageMaker Neo expect? \(p. 2023\)](#). For more information about devices and frameworks supported by Neo, see [Supported Frameworks, Devices, Systems, and Architectures \(p. 2063\)](#).

Use the `CreateCompilationJob` API to create a compilation job with SageMaker Neo. Provide a name to the compilation job, the SageMaker Role ARN, the Amazon S3 URI where your model is stored, the input shape of the model, the name of the framework, the Amazon S3 URI where you want SageMaker to store your compiled model, and your edge device target.

```
# Specify the path where your model is stored  
model_directory = 'models'  
s3_model_uri = 's3://{}//{}//{}'.format(bucket, model_directory, model_filename)  
  
# Store compiled model in S3 within the 'compiled-models' directory  
compilation_output_dir = 'compiled-models'  
s3_output_location = 's3://{}//{}//{}'.format(bucket, compilation_output_dir)  
  
# Give your compilation job a name  
compilation_job_name = 'getting-started-demo'  
  
sagemaker_client.create_compilation_job(CompilationJobName=compilation_job_name,  
                                         RoleArn=sagemaker_role_arn,  
                                         InputConfig={  
                                             'S3Uri': s3_model_uri,  
                                             'DataInputConfig': data_shape,  
                                             'Framework': framework.upper()},  
                                         OutputConfig={  
                                             'S3OutputLocation': s3_output_location,  
                                             'TargetDevice': target_device},  
                                         StoppingCondition={'MaxRuntimeInSeconds': 900})
```

### 5. Package your compiled model.

Packaging jobs take SageMaker Neo-compiled models and make any changes necessary to deploy the model with the inference engine, Edge Manager agent. To package your model, create an edge packaging job with the `create_edge_packaging` API or the SageMaker console.

You need to provide the name that you used for your Neo compilation job, a name for the packaging job, a role ARN (see [Setting Up \(p. 2087\)](#) section), a name for the model, a model version, and the Amazon S3 bucket URI for the output of the packaging job. Note that Edge Manager packaging job names are case-sensitive. The following is an example of how to create a packaging job using the API.

```
edge_packaging_name='edge-packaging-demo'  
model_name="sample-model"  
model_version="1.1"
```

Define the Amazon S3 URI where you want to store the packaged model.

```
# Output directory where you want to store the output of the packaging job  
packaging_output_dir = 'packaged_models'  
packaging_s3_output = 's3://{}{}'.format(bucket, packaging_output_dir)
```

Use `CreateEdgePackagingJob` to package your Neo-compiled model. Provide a name for your edge packaging job and the name you provided for your compilation job (in this example, it was stored in the variable `compilation_job_name`). Also provide a name for your model, a version for your model (this is used to help you keep track of what model version you are using), and the S3 URI where you want SageMaker to store the packaged model.

```
sagemaker_client.create_edge_packaging_job(  
    EdgePackagingJobName=edge_packaging_name,  
    CompilationJobName=compilation_job_name,  
    RoleArn=sagemaker_role_arn,  
    ModelName=model_name,  
    ModelVersion=model_version,  
    OutputConfig={  
        "S3OutputLocation": packaging_s3_output  
    }  
)
```

## Create and Register Fleets and Authenticate Devices

In this section you will create your Amazon IoT thing object, create a device fleet, register your device fleet so it can interact with the cloud, create X.509 certificates to authenticate your devices to Amazon IoT Core, associate the role alias with Amazon IoT that was generated when you created your fleet, get your Amazon account-specific endpoint for the credentials provider, get an official Amazon Root CA file, and upload the Amazon CA file to Amazon S3.

### 1. Create Amazon IoT things.

SageMaker Edge Manager takes advantage of the Amazon IoT Core services to facilitate the connection between the edge devices and endpoints in the Amazon cloud. You can take advantage of existing Amazon IoT functionality after you set up your devices to work with Edge Manager.

To connect your device to Amazon IoT, you need to create Amazon IoT *thing objects*, create and register a client certificate with Amazon IoT, and create and configure the IAM role for your devices.

First, create Amazon IoT thing objects with the Amazon IoT client (`iot_client`) you created earlier with Boto3. The following example shows how to create two thing objects:

```

iot_thing_name = 'sample-device'
iot_thing_type = 'getting-started-demo'

iot_client.create_thing_type(
    thingTypeName=iot_thing_type
)

# Create an Amazon IoT thing objects
iot_client.create_thing(
    thingName=iot_thing_name,
    thingTypeName=iot_thing_type
)

```

## 2. Create your device fleet.

Create a device fleet with the SageMaker client object defined in a previous step. You can also use the SageMaker console to create a device fleet.

```

device_fleet_name="demo-device-fleet" + str(time.time()).split('.')[0]
device_name="sagemaker-edge-demo-device" + str(time.time()).split('.')[0]

```

Specify your IoT role ARN. This lets Amazon IoT grant temporary credentials to devices.

```

device_model_directory='device_output'
s3_device_fleet_output = 's3://{}{}'.format(bucket, device_model_directory)

sagemaker_client.create_device_fleet(
    DeviceFleetName=device_fleet_name,
    RoleArn=iot_role_arn, # IoT Role ARN specified in previous step
    OutputConfig={
        'S3OutputLocation': s3_device_fleet_output
    }
)

```

An Amazon IoT role alias is created when you create a device fleet. This role alias is associated with Amazon IoT using the `iot_client` object in a later step.

## 3. Register your device fleet.

To interact with the cloud, you need to register your device with SageMaker Edge Manager. In this example, you register a single device with the fleet you created. To register the device, you need to provide a device name and the Amazon IoT thing name as shown in the following example:

```

# Device name should be 36 characters
device_name = "sagemaker-edge-demo-device" + str(time.time()).split('.')[0]

sagemaker_client.register_devices(
    DeviceFleetName=device_fleet_name,
    Devices=[
        {
            "DeviceName": device_name,
            "IotThingName": iot_thing_name
        }
    ]
)

```

## 4. Create X.509 certificates.

After creating the Amazon IoT thing object, you must create a X.509 device certificate for your thing object. This certificate authenticates your device to Amazon IoT Core.

Use the following to create a private key, public key, and a X.509 certificate file using the Amazon IoT client defined (`iot_client`) earlier.

```
# Creates a 2048-bit RSA key pair and issues an X.509 certificate
# using the issued public key.
create_cert = iot_client.create_keys_and_certificate(
    setAsActive=True
)

# Get certificate from dictionary object and save in its own
with open('./device.pem.crt', 'w') as f:
    for line in create_cert['certificatePem'].split('\n'):
        f.write(line)
        f.write('\n')

# Get private key from dictionary object and save in its own
with open('./private.pem.key', 'w') as f:
    for line in create_cert['keyPair']['PrivateKey'].split('\n'):
        f.write(line)
        f.write('\n')

# Get a private key from dictioanary object and save in its own
with open('./public.pem.key', 'w') as f:
    for line in create_cert['keyPair']['PublicKey'].split('\n'):
        f.write(line)
        f.write('\n')
```

## 5. Associate the role alias with Amazon IoT.

When you create a device fleet with SageMaker (`sagemaker_client.create_device_fleet()`), a role alias is generated for you. An Amazon IoT role alias provides a mechanism for connected devices to authenticate to Amazon IoT using X.509 certificates, and then obtain short-lived Amazon credentials from an IAM role that is associated with an Amazon IoT role alias. The role alias allows you to change the role of the device without having to update the device. Use `DescribeDeviceFleet` to get the role alias name and ARN.

```
# Print Amazon Resource Name (ARN) and alias that has access
# to Amazon Internet of Things (IoT).
sagemaker_client.describe_device_fleet(DeviceFleetName=device_fleet_name)

# Store iot role alias string in a variable
# Grabs role ARN
full_role_alias_name =
    sagemaker_client.describe_device_fleet(DeviceFleetName=device_fleet_name)
['IotRoleAlias']
start_index = full_role_alias_name.find('SageMaker') # Find beginning of role name
role_alias_name = full_role_alias_name[start_index:]
```

Use the `iot_client` to facilitate associating the role alias generated from creating the device fleet with Amazon IoT:

```
role_alias = iot_client.describe_role_alias(
    roleAlias=role_alias_name)
```

For more information about IAM role alias, see [Role alias allows access to unused services](#).

You created and registered a certificate with Amazon IoT earlier for successful authentication of your device. Now, you need to create and attach a policy to the certificate to authorize the request for the security token.

```
alias_policy = {
```

```

    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "iot:AssumeRoleWithCertificate",
            "Resource": role_alias['roleAliasDescription']['roleAliasArn']
        }
    }

policy_name = 'aliaspolicy-' + str(time.time()).split('.')[0]
aliaspolicy = iot_client.create_policy(policyName=policy_name,
                                        policyDocument=json.dumps(alias_policy))

# Attach policy
iot_client.attach_policy(policyName=policy_name,
                         target=create_cert['certificateArn'])

```

## 6. Get your Amazon account-specific endpoint for the credentials provider.

Edge devices need an endpoint in order to assume credentials. Obtain your Amazon account-specific endpoint for the credentials provider.

```

# Get the unique endpoint specific to your Amazon account that is making the call.
iot_endpoint = iot_client.describe_endpoint(
    endpointType='iot:CredentialProvider'
)

endpoint="https://{}//role-aliases/{}/credentials".format(iot_endpoint['endpointAddress'],role_alias_name)

```

## 7. Get the official Amazon root CA file and upload it to the Amazon S3 bucket.

Use the following in your Jupyter Notebook or Amazon CLI (if you use your terminal, remove the '!' magic function):

```
!wget https://www.amazontrust.com/repository/AmazonRootCA1.pem
```

Use the endpoint to make an HTTPS request to the credentials provider to return a security token. The following example command uses curl, but you can use any HTTP client.

```
!curl --cert device.pem.crt --key private.pem.key --cacert AmazonRootCA1.pem $endpoint
```

If the certificate is verified, upload the keys and certificate to your Amazon S3 bucket URI:

```
!aws s3 cp private.pem.key s3://{}bucket}/authorization-files/
!aws s3 cp device.pem.crt s3://{}bucket}/authorization-files/
!aws s3 cp AmazonRootCA1.pem s3://{}bucket}/authorization-files/
```

## Download and Set Up Edge Manager

The Edge Manager agent is an inference engine for your edge devices. Use the agent to make predictions with models loaded onto your edge devices. The agent also collects model metrics and captures data at specific intervals.

In this section you will set up your device with the agent. To do so, first copy a release artifact and signing root certificate from the release bucket locally to your machine. After you unzip the release artifact, upload it to Amazon S3. Next, define and save a configuration file for the agent. A template is

provided for you to copy and paste. Finally, copy the release artifacts, configuration file, and credentials to your device.

### 1. Download the SageMaker Edge Manager agent.

The agent is released in binary format for supported operating systems. This example runs inference on a Linux platform (Raspberry Pi OS is based on Debian). Fetch the latest version of binaries from the SageMaker Edge Manager release bucket from the us-west-2 Region.

```
aws s3 ls s3://sagemaker-edge-release-store-us-west-2-windows-x86 Releases/ | sort -r
```

This returns release artifacts sorted by their version.

```
2020-12-01 23:33:36 0  
PRE 1.20201218.81f481f/  
PRE 1.20201207.02d0e97/
```

The version has the following format: <MAJOR\_VERSION>. <YYYY-MM-DD>-<SHA-7>. It consists of three components:

- <MAJOR\_VERSION>: The release version. The release version is currently set to 1.
- <YYYY-MM-DD>: The time stamp of the artifact release.
- <SHA-7>: The repository commit ID from which the release is built.

Copy the zipped TAR file locally or to your device directly. The following example shows how to copy the latest release artifact at the time this document was released.

```
!aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/  
Releases/1.20201218.81f481f/1.20201218.81f481f.tgz ./
```

Once you have the artifact, unzip the zipped TAR file:

```
!mkdir agent_demo  
!tar -xvzf 1.20201218.81f481f.tgz -C ./agent_demo
```

You also need the signing root certificates from the release bucket:

```
!aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/Certificates/us-  
west-2/us-west-2.pem ./
```

### 2. Define a SageMaker Edge Manager agent configuration file.

First, define the agent configuration file as follows:

```
sagemaker_edge_config = {  
    "sagemaker_edge_core_device_name": "device_name",  
    "sagemaker_edge_core_device_fleet_name": "device_fleet_name",  
    "sagemaker_edge_core_capture_data_buffer_size": 30,  
    "sagemaker_edge_core_capture_data_push_period_seconds": 4,  
    "sagemaker_edge_core_folder_prefix": "demo_capture",  
    "sagemaker_edge_core_region": "us-west-2",  
    "sagemaker_edge_core_root_certs_path": "/agent_demo/certificates",  
    "sagemaker_edge_provider_aws_ca_cert_file": "/agent_demo/iot-credentials/  
AmazonRootCA1.pem",
```

```
        "sagemaker_edge_provider_aws_cert_file": "/agent_demo/iot-credentials/  
device.pem.crt",  
        "sagemaker_edge_provider_aws_cert_pk_file": "/agent_demo/iot-credentials/  
private.pem.key",  
        "sagemaker_edge_provider_aws_iot_cred_endpoint": "endpoint",  
        "sagemaker_edge_provider_provider": "Aws",  
        "sagemaker_edge_provider_s3_bucket_name": bucket,  
        "sagemaker_edge_core_capture_data_destination": "Cloud"  
    }
```

Next, save it as a JSON file:

```
edge_config_file = open("sagemaker_edge_config.json", "w")  
json.dump(sagemaker_edge_config, edge_config_file, indent = 6)  
edge_config_file.close()
```

Replace the following:

- "device\_name" with the name of your device (this string was stored in an earlier step in a variable named device\_name).
- "device\_fleet\_name" with the name of your device fleet (this string was stored an earlier step in a variable named device\_fleet\_name)
- "endpoint" with your Amazon account-specific endpoint for the credentials provider (this string was stored in an earlier step in a variable named endpoint).

### 3. Copy the release artifacts, configuration file, and credentials to your device.

The following instructions are performed on the edge device itself.

**Note**

You must first install Python, the Amazon SDK for Python (Boto3), and the Amazon CLI on your edge device.

Open a terminal on your device. Create a folder to store the release artifacts, your credentials, and the configuration file.

```
mkdir agent_demo  
cd agent_demo
```

Copy the contents of the release artifacts that you stored in your Amazon S3 bucket to your device:

```
# Copy release artifacts  
aws s3 cp s3://sagemaker-edge-manager-demo/release_artifacts/ ./ --recursive
```

Go the /bin directory and make the binary files executable:

```
cd bin  
  
chmod +x sagemaker_edge_agent_binary  
chmod +x sagemaker_edge_agent_client_example  
  
cd agent_demo
```

Make a directory to store your Amazon IoT credentials and copy your credentials from your Amazon S3 bucket to your edge device (use the same on you define in the variable bucket):

```
mkdir iot-credentials  
cd iot-credentials
```

```
aws s3 cp s3://<bucket-name>/authorization-files/AmazonRootCA1.pem ./
aws s3 cp s3://<bucket-name>/authorization-files/device.pem.crt ./
aws s3 cp s3://<bucket-name>/authorization-files/private.pem.key ./

cd ../
```

Make a directory to store your model signing root certificates:

```
mkdir certificates
cd certificates
aws s3 cp s3://<bucket-name>/certificates/us-west-2.pem ./
cd agent_demo
```

Copy your configuration file to your device:

```
#Download config file from S3
aws s3 cp s3://<bucket-name>/config_files/sagemaker_edge_config.json ./
cd agent_demo
```

Your agent\_demo directory on your edge device should look similar to the following:

```
###agent_demo
|   ### bin
|       ### sagemaker_edge_agent_binary
|       ### sagemaker_edge_agent_client_example
|   ### sagemaker_edge_config.json
|   ### certificates
|       ###us-west-2.pem
|   ### iot-credentials
|       ### AmazonRootCA1.pem
|       ### device.pem.crt
|       ### private.pem.key
|   ### docs
|       ### api
|       ### examples
|   ### ATTRIBUTIONS.txt
|   ### LICENSE.txt
|   ### RELEASE_NOTES.md
```

## Run Agent

In this section you will run the agent as a binary using gRPC, and check that both your device and fleet are working and collecting sample data.

### 1. Launch the agent.

The SageMaker Edge Manager agent can be run as a standalone process in the form of an Executable and Linkable Format (ELF) executable binary or can be linked against as a Dynamic Shared Object (.dll). Running as a standalone executable binary is the preferred mode and is supported on Linux.

This example uses gRPC to run the agent. gRPC is an open source high-performance Remote Procedure Call (RPC) framework that can run in any environment. For more information about gRPC, see the [gRPC documentation](#).

To use gRPC, perform the following steps:

- a. Define a service in a .proto file.
- b. Generate server and client code using the protocol buffer compiler.
- c. Use the Python (or other languages supported by gRPC) gRPC API to write the server for your service.
- d. Use the Python (or other languages supported by gRPC) gRPC API to write a client for your service.

The release artifact you downloaded contains a gRPC application ready for you to run the agent. The example is located within the /bin directory of your release artifact. The sagemaker\_edge\_agent\_binary executable is in this directory.

To run the agent with this example, provide the path to your socket file (.sock) and JSON .config file:

```
./bin/sagemaker_edge_agent_binary -a /tmp/sagemaker_edge_agent_example.sock -c sagemaker_edge_config.json
```

## 2. Check your device.

Check that your device is connected and sampling data. Making periodic checks, manually or automatically, allows you to check that your device or fleet is working properly.

Provide the name of the fleet to which the device belongs and the unique device identifier. From your local machine, run the following:

```
sagemaker_client.describe_device(  
    DeviceName=device_name,  
    DeviceFleetName=device_fleet_name  
)
```

For the given model, you can see the name, model version, latest sample time, and when the last inference was made.

```
{  
    "DeviceName": "sample-device",  
    "DeviceFleetName": "demo-device-fleet",  
    "IoTThingName": "sample-thing-name-1",  
    "RegistrationTime": 1600977370,  
    "LatestHeartbeat": 1600977370,  
    "Models": [  
        {  
            "ModelName": "mobilenet_v2.tar.gz",  
            "ModelVersion": "1.1",  
            "LatestSampleTime": 1600977370,  
            "LatestInference": 1600977370  
        }  
    ]  
}
```

The timestamp provided by `LastetHeartbeat` indicates the last signal that was received from the device. `LatestSampleTime` and `LatestInference` describe the time stamp of the last data sample and inference, respectively.

## 3. Check your fleet.

Check that your fleet is working with `GetDeviceFleetReport`. Provide the name of the fleet the device belongs to.

```
sagemaker_client.get_device_fleet_report(  
    DeviceFleetName=device_fleet_name  
)
```

For a given model, you can see the name, model version, latest sample time, and when the last inference was made, along with the Amazon S3 bucket URL where the data samples are stored.

```
# Sample output  
{  
    "DeviceFleetName": "sample-device-fleet",  
    "DeviceFleetArn": "arn:aws:sagemaker:us-west-2:999999999999:device-fleet/sample-fleet-name",  
    "OutputConfig": {  
        "S3OutputLocation": "s3://fleet-bucket/package_output",  
    },  
    "AgentVersions": [{"Version": "1.1", "AgentCount": 2}],  
    "DeviceStats": {"Connected": 2, "Registered": 2},  
    "Models": [  
        {"ModelName": "sample-model",  
         "ModelVersion": "1.1",  
         "OfflineDeviceCount": 0,  
         "ConnectedDeviceCount": 2,  
         "ActiveDeviceCount": 2,  
         "SamplingDeviceCount": 100  
    ]  
}
```

## Set Up Devices and Fleets

Fleets are collections of logically grouped devices you can use to collect and analyze data. You can use SageMaker Edge Manager to operate machine learning models on a fleet of smart cameras, smart speakers, robots, and other edge devices.

Create a fleet and register your devices either programmatically with the Amazon SDK for Python (Boto3) or through the SageMaker console.

### Topics

- [Create a Fleet \(p. 2100\)](#)
- [Register a Device \(p. 2104\)](#)
- [Check Status \(p. 2106\)](#)

## Create a Fleet

You can create a fleet programmatically with the Amazon SDK for Python (Boto3) or through the SageMaker console <https://console.amazonaws.cn/sagemaker>.

### Create a Fleet (Boto3)

Use the `CreateDeviceFleet` API to create a fleet. Specify a name for the fleet, your Amazon IoT Role ARN for the `RoleArn` field, as well as an Amazon S3 URI where you want the device to store sampled data.

You can optionally include a description of the fleet, tags, and an Amazon KMS Key ID.

```
import boto3

# Create SageMaker client so you can interact and manage SageMaker resources
sagemaker_client = boto3.client("sagemaker", region_name="aws-region")

sagemaker_client.create_device_fleet(
    DeviceFleetName="sample-fleet-name",
    RoleArn="arn:aws:iam::9999999999:role/rolename", # IoT Role ARN
    Description="fleet description",
    OutputConfig={
        S3OutputLocation="s3://bucket/",
        KMSKeyId: "1234abcd-12ab-34cd-56ef-1234567890ab",
    },
    Tags=[
        {
            "Key": "string",
            "Value" : "string"
        }
    ],
)
```

An Amazon IoT Role Alias is created for you when you create a device fleet. The Amazon IoT role alias provides a mechanism for connected devices to authenticate to Amazon IoT using X.509 certificates and then obtain short-lived Amazon credentials from an IAM role that is associated with the Amazon IoT role alias.

Use `DescribeDeviceFleet` to get the role alias name and ARN.

```
# Print Amazon Resource Name (ARN) and alias that has access
# to Amazon Internet of Things (IoT).
sagemaker_client.describe_device_fleet(DeviceFleetName=device_fleet_name)['IoTRoleAlias']
```

Use `DescribeDeviceFleet` API to get a description of fleets you created.

```
sagemaker_client.describe_device_fleet(
    DeviceFleetName="sample-fleet-name"
)
```

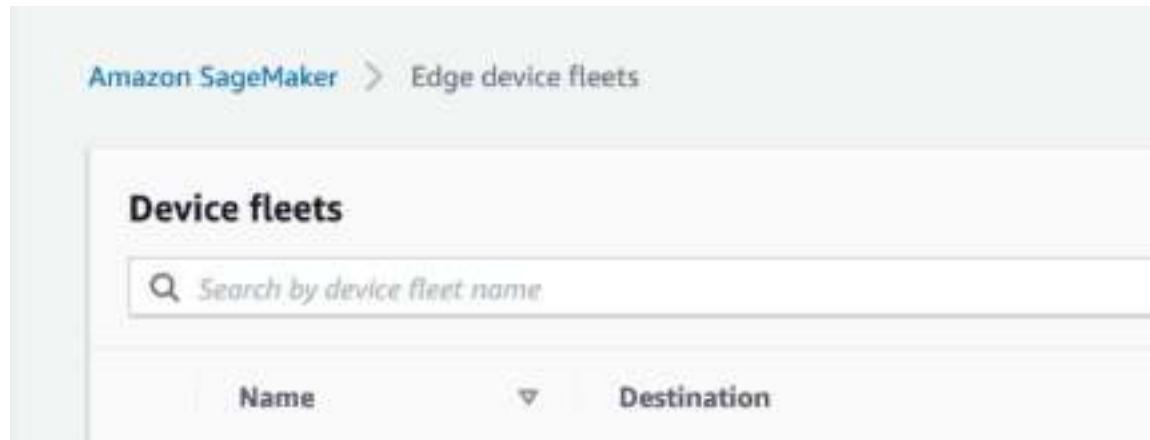

By default, it returns the name of the fleet, the device fleet ARN, the Amazon S3 bucket URI, the IAM role, the role alias created in Amazon IoT, a timestamp of when the fleet was created, and a timestamp of when the fleet was last modified.

```
{
    "DeviceFleetName": "sample-fleet-name",
    "DeviceFleetArn": "arn:aws:sagemaker:us-west-2:9999999999:device-fleet/sample-fleet-name",
    "IAMRole": "arn:aws:iam::9999999999:role/rolename",
    "Description": "this is a sample fleet",
    "IoTRoleAlias": "arn:aws:iot:us-west-2:9999999999:rolealias/SagemakerEdge-sample-fleet-name",
    "OutputConfig": {
        "S3OutputLocation": "s3://bucket/folder",
        "KMSKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab"
    },
    "CreationTime": "1600977370",
    "LastModifiedTime": "1600977370"
}
```

## Create a Fleet (Console)

You can create a Edge Manager packaging job using the Amazon SageMaker console at <https://console.amazonaws.cn/sagemaker>.

1. In the SageMaker console, choose **Edge Inference** and then choose **Edge device fleets**.
2. Choose **Create device fleet**.

3. Enter a name for the device fleet in the **Device fleet name** field. Choose **Next**.

## Device fleet properties

Use the fields below to enter the name and the role for your device fleet.

Device fleet name

device-fleet-test

Device fleet description - *optional*

*Enter a description here*

512 character max

IAM role - *optional*

The role for  IoT to use when granting temporary

*Enter the role ARN*

Device fleet tags - *optional*

Key

4. On the **Output configuration** page, specify the Amazon S3 bucket URI where you want to store sample data from your device fleet. You can optionally add an encryption key as well by electing an existing Amazon KMS key from the dropdown list or by entering a key's ARN. Choose **Submit**.

The screenshot shows the 'Output configuration' section of a device fleet setup. It includes fields for an S3 bucket URI (containing 's3://bucket-example/sagemaker-edge/device-output'), an optional encryption key (set to 'No Custom Encryption'), and a 'Cancel' button.

**Output configuration**

Use the fields below to specify the S3 bucket URI where you want devices to store sample data. You can also (optionally) specify a KMS key.

**S3 bucket URI**  
Enter your S3 bucket URI where you want devices to store sample data.  
`s3://bucket-example/sagemaker-edge/device-output`

To find a path, [go to Amazon S3](#)

**Encryption key - optional**  
Encrypt your data. Choose an existing KMS key or enter a key's ARN.  
`No Custom Encryption`

[Cancel](#)

5. Choose the name of your device fleet to be redirected to the device fleet details. This page displays the name of the device fleet, ARN, description (if you provided one), date the fleet was created, last time the fleet was modified, Amazon S3 bucket URI, Amazon KMS key ID (if provided), Amazon IoT alias (if provided), and IAM role. If you added tags, they appear in the **Device fleet tags** section.

## Register a Device

### Important

Device registration is required to use any part of SageMaker Edge Manager.

You can create a fleet programmatically with the Amazon SDK for Python (Boto3) or through the SageMaker console at <https://console.amazonaws.cn/sagemaker>.

### Register a Device (Boto3)

To register your device, first create and register an Amazon IoT thing object and configure an IAM role. SageMaker Edge Manager takes advantage of the Amazon IoT Core services to facilitate the connection between the edge devices and the cloud. You can take advantage of existing Amazon IoT functionality after you set up your devices to work with Edge Manager.

To connect your device to Amazon IoT you need to create Amazon IoT thing objects, create and register a client certificate with Amazon IoT, and create and configure IAM role for your devices.

See the [Getting Started Guide](#) for an in-depth example or the [Explore Amazon IoT Core services in hands-on tutorial](#).

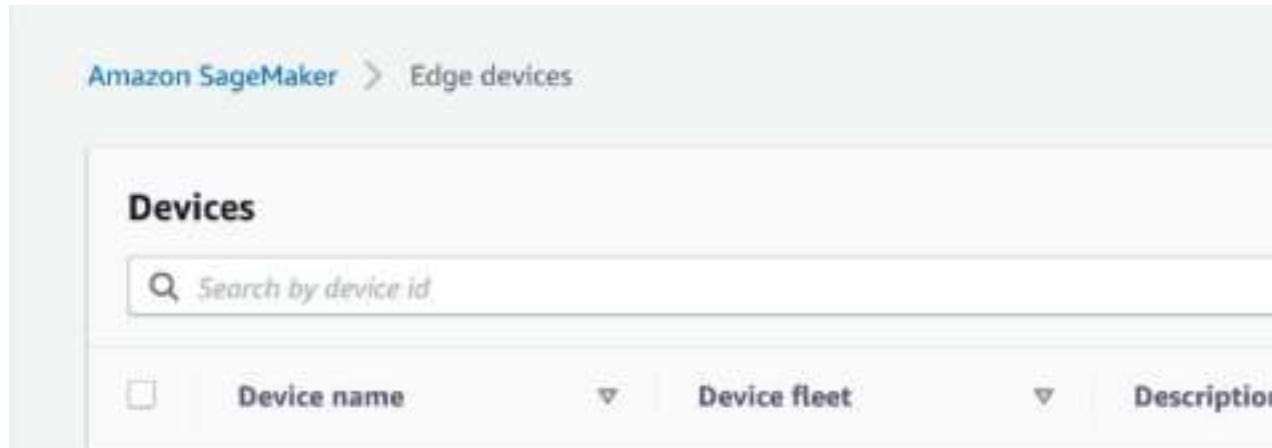

Use the `RegisterDevices` API to register your device. Provide the name of the fleet of which you want the devices to be a part, as well as a name for the device. You can optionally add a description to the device, tags, and Amazon IoT thing name associated with the device.

```
sagemaker_client.register_devices(  
    DeviceFleetName="sample-fleet-name",  
    Devices=[  
        {  
            "DeviceName": "sample-device-1",  
            "IoTThingName": "sample-thing-name-1",  
            "Description": "Device #1"  
        }  
    ],  
    Tags=[  
        {  
            "Key": "string",  
            "Value" : "string"  
        }  
    ]  
)
```

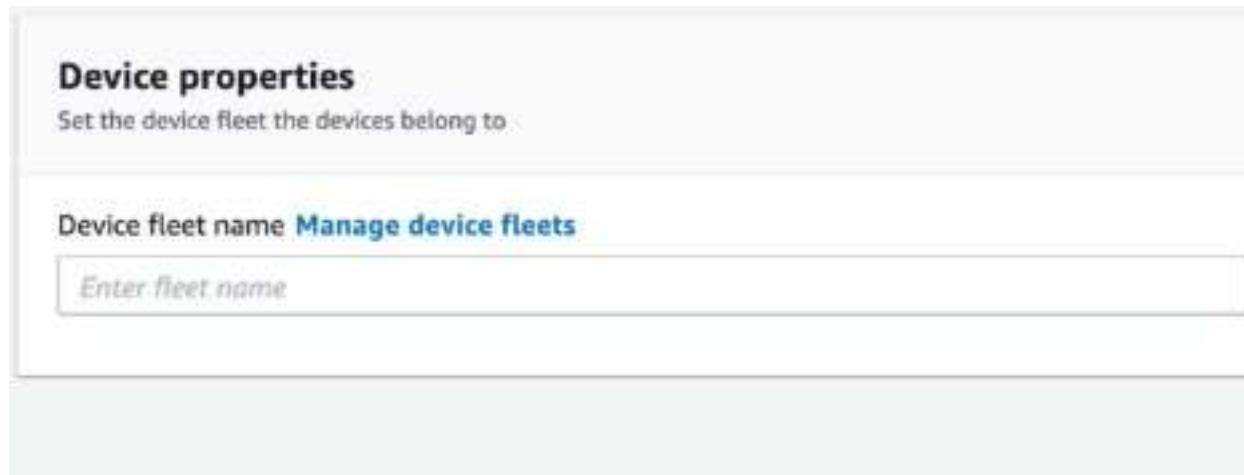

## Register a Device (Console)

You can register your device using the SageMaker console at <https://console.amazonaws.cn/sagemaker>.

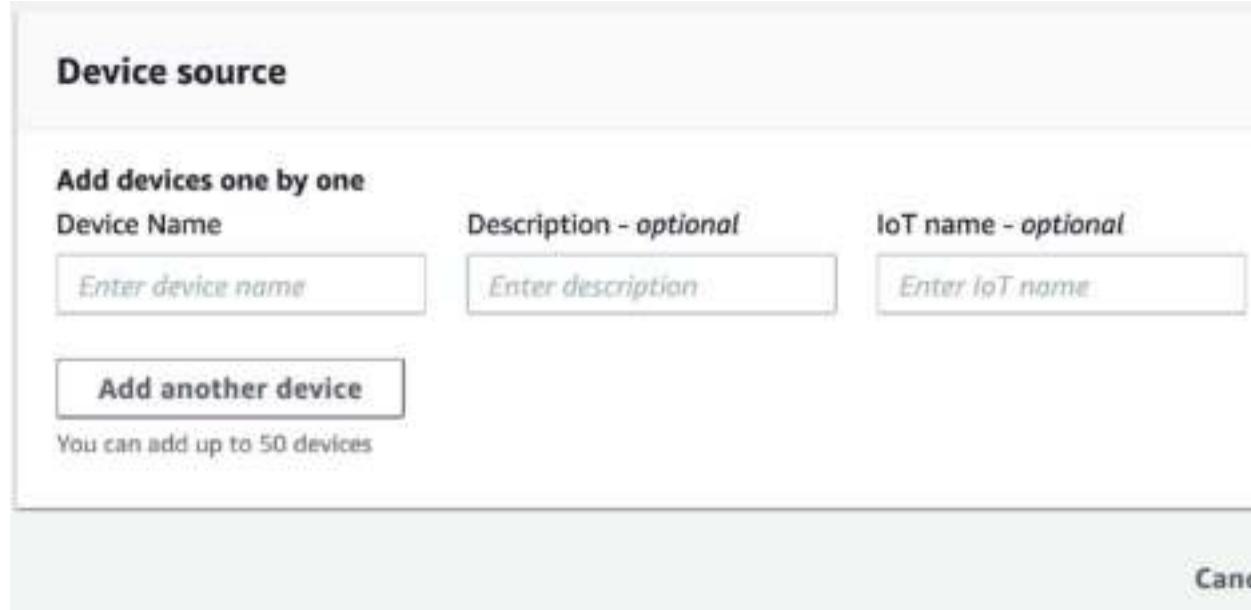

1. In the SageMaker console, choose **Edge Inference** and then choose **Edge devices**.
2. Choose **Register devices**.

3. In the **Device properties** section, enter the name of the fleet the device belongs to under the **Device fleet name** field. Choose **Next**.

4. In the **Device source** section, add your devices one by one. You must include a **Device Name** for each device in your fleet. You can optionally provide a description (in the **Description** field) and an Internet of Things (IoT) object name (in the **IoT name** field). Choose **Submit** once you have added all your devices.

The **Devices** page displays the name of the device you have added, the fleet to which it belongs, when it was registered, the last heartbeat, and the description and Amazon IoT name, if you provided one.

Choose a device to view the device's details, including the device name, fleet, ARN, description, IoT Thing name, when the device was registered, and the last heartbeat.

## Check Status

Check that your device or fleet is connected and sampling data. Making periodic checks, manually or automatically, allows you to check that your device or fleet is working properly.

Use the Amazon S3 console at <https://console.amazonaws.cn/s3/> to interactively choose a fleet for a status check. You can also use the Amazon SDK for Python (Boto3). The following describes different APIs from Boto3 you can use to check the status of your device or fleet. Use the API that best fits your use case.

- **Check an individual device.**

To check the status of an individual device, use `DescribeDevice` API. A list containing one or more models is provided if a models have been deployed to the device.

```
sagemaker_client.describe_device(  
    DeviceName="sample-device-1",  
    DeviceFleetName="sample-fleet-name"  
)
```

Running `DescribeDevice` returns:

```
{ "DeviceName": "sample-device".
```

```
"Description": "this is a sample device",
"DeviceFleetName": "sample-device-fleet",
"IoTThingName": "SampleThing",
"RegistrationTime": 1600977370,
"LatestHeartbeat": 1600977370,
"Models": [
    {
        "ModelName": "sample-model",
        "ModelVersion": "1.1",
        "LatestSampleTime": 1600977370,
        "LatestInference": 1600977370
    }
]
```

- **Check a fleet of devices.**

To check the status of the fleet, use the `GetDeviceFleetReport` API. Provide the name of the device fleet to get a summary of the fleet.

```
sagemaker_client.get_device_fleet_report(
    DeviceFleetName="sample-fleet-name"
)
```

- **Check for a heartbeat.**

Each device within a fleet periodically generates a signal, or “heartbeat”. The heartbeat can be used to check that the device is communicating with Edge Manager. If the timestamp of the last heartbeat is not being updated, the device may be failing.

Check the last heartbeat made by a device with the `DescribeDevice` API. Specify the name of the device and the fleet to which the edge device belongs.

```
sagemaker_client.describe_device(
    DeviceName="sample-device-1",
    DeviceFleetName="sample-fleet-name"
)
```

## Package Model

SageMaker Edge Manager packaging jobs take Amazon SageMaker Neo-compiled models and make any changes necessary to deploy the model with the inference engine, Edge Manager agent.

### Topics

- [Prerequisites \(p. 2107\)](#)
- [Package a Model \(Amazon SageMaker Console\) \(p. 2109\)](#)
- [Package a Model \(Boto3\) \(p. 2112\)](#)

## Prerequisites

To package a model, you must do the following:

1. **Compile your machine learning model with SageMaker Neo.**

If you have not already done so, compile your model with SageMaker Neo. For more information on how to compile your model, see [Compile and Deploy Models with Neo](#). If you are first-time user of SageMaker Neo, go through [Getting Started with Neo Edge Devices](#).

**2. Get the name of your compilation job.**

Provide the name of the compilation job name you used when you compiled your model with SageMaker Neo. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/> and choose **Compilation jobs** to find a list of compilations that have been submitted to your Amazon account. The names of submitted compilation jobs are in the **Name** column.

**3. Get your IAM ARN.**

You need an Amazon Resource Name (ARN) of an IAM role that you can use to download and upload the model and contact SageMaker Neo.

Use one of the following methods to get your IAM ARN:

- **Programmatically with the SageMaker Python SDK**

```
import sagemaker

# Initialize SageMaker Session object so you can interact with Amazon resources
sess = sagemaker.Session()

# Get the role ARN
role = sagemaker.get_execution_role()

print(role)
>> arn:aws:iam::<your-aws-account-id>:role/<your-role-name>
```

For more information about using the SageMaker Python SDK, see the [SageMaker Python SDK API](#).

- **Using the Amazon Identity and Access Management (IAM) console**

Navigate to the IAM console at <https://console.amazonaws.cn/iam/>. In the **IAM Resources** section, choose **Roles** to view a list of roles in your Amazon account. Select or create a role that has **AmazonSageMakerFullAccess**, **AWSIoTFullAccess**, and **AmazonS3FullAccess**.

For more information on IAM, see [What is IAM?](#)

**4. Have an S3 bucket URI.**

You need to have at least one Amazon Simple Storage Service (Amazon S3) bucket URI to store your Neo-compiled model, the output of the Edge Manager packaging job, and sample data from your device fleet.

Use one of the following methods to create an Amazon S3 bucket:

- **Programmatically with the SageMaker Python SDK**

You can use the default Amazon S3 bucket during a session. A default bucket is created based on the following format: `sagemaker-{region}-{aws-account-id}`. To create a default bucket with the SageMaker Python SDK, use the following:

```
import sagemaker

session=sagemaker.create_session()

bucket=session.default_bucket()
```

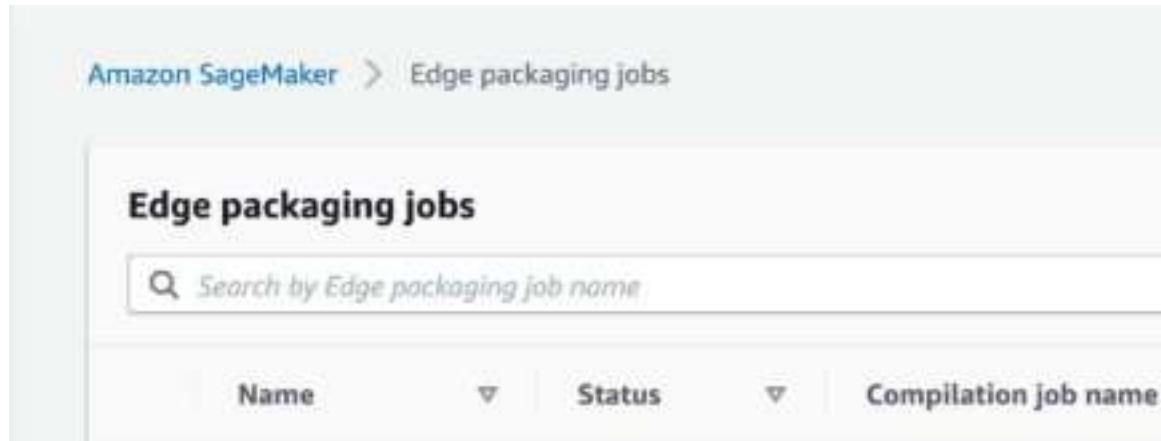

- **Using the Amazon S3 console**

Open the Amazon S3 console at <https://console.amazonaws.cn/s3/> and see [How do I create an S3 Bucket?](#) for step-by-step instructions.

## Package a Model (Amazon SageMaker Console)

You can create a SageMaker Edge Manager packaging job using the SageMaker console at <https://console.amazonaws.cn/sagemaker/>. Before continuing, make sure you have satisfied the [Prerequisites \(p. 2107\)](#).

1. In the SageMaker console, choose **Edge Inference** and then choose **Edge packaging jobs**, as shown in the following image.

2. On the **Job properties** page, enter a name for your packaging job under **Edge packaging job name**. Note that Edge Manager packaging job names are case-sensitive. Name your model and give it a version: enter this under **Model name** and **Model version**, respectively.
3. Next, select an **IAM role**. You can chose a role or let Amazon create a role for you. You can optionally specify a **resource key ARN** and **job tags**.
4. Choose **Next**.

## Job properties

Edge packaging job name

sample-edge-package

63 characters max

Model name

sample-model

128 characters max

Model version

1

128 characters max

IAM role

Amazon SageMaker Edge requires permissions to create an [AmazonSageMakerFullAccess](#) IAM policy attached.

Admin

---

Resource key ARN - *optional*

Enter the resource key to encrypt the EBS volume the

- Specify the name of the compilation job you used when compiling your model with SageMaker Neo in the **Compilation job name** field. Choose **Next**.

**Model source**

Specify the name of your SageMaker Neo compilation job in the field below. SageMaker Edge needs to know the model artifacts.

**Compilation job name**

Specify the name of the compilation job you used when compiling your model with SageMaker Neo. Compile your code before moving on if you have not done so yet. [Manage compilation jobs](#)

getting-started-demo

**Cancel**

- On the **Output configuration** page, enter the Amazon S3 bucket URI in which you want to store the output of the packaging job.

**Output configuration**

Use the fields below to specify the S3 bucket URI where you want devices to store sample data. You can also (optionally) specify a KMS key.

**S3 bucket URI**

Enter your S3 bucket URI where you want devices to store sample data.

s3://bucket-example/sagemaker-edge/device-output

To find a path, [go to Amazon S3](#)

**Encryption key - optional**

Encrypt your data. Choose an existing KMS key or enter a key's ARN.

No Custom Encryption

**Cancel**

The **Status** column on the **Edge packaging** jobs page should read **IN PROGRESS**. Once the packaging job is complete, the status updates to **COMPLETED**.

Selecting a packaging job directs you to that job's settings. The **Job settings** section displays the job name, ARN, status, creation time, last modified time, duration of the packaging job, and role ARN.

The **Input configuration** section displays the location of the model artifacts, the data input configuration, and the machine learning framework of the model.

The **Output configuration** section displays the output location of the packaging job, the target device for which the model was compiled, and any tags you created.

7. Choose the name of your device fleet to be redirected to the device fleet details. This page displays the name of the device fleet, ARN, description (if you provided one), date the fleet was created, last time the fleet was modified, Amazon S3 bucket URI, Amazon KMS key ID (if provided), Amazon IoT alias (if provided), and IAM role. If you added tags, they appear in the **Device fleet tags** section.

## Package a Model (Boto3)

You can create a SageMaker Edge Manager packaging job with the Amazon SDK for Python (Boto3). Before continuing, make sure you have satisfied the [Prerequisites \(p. 2107\)](#).

To request an edge packaging job, use `CreateEdgePackagingJob`. You need to provide a name to your edge packaging job, the name of your SageMaker Neo compilation job, your role Amazon resource name (ARN), a name for your model, a version for your model, and the Amazon S3 bucket URI where you want to store the output of your packaging job. Note that Edge Manager packaging job names and SageMaker Neo compilation job names are case-sensitive.

```
# Import Amazon SDK for Python (Boto3)
import boto3

# Create Edge client so you can submit a packaging job
sagemaker_client = boto3.client("sagemaker", region_name='aws-region')

sagemaker_client.create_edge_packaging_job(
    EdgePackagingJobName="edge-packaging-name",
    CompilationJobName="neo-compilation-name",
    RoleArn="arn:aws:iam::999999999999:role/rolename",
    ModelName="sample-model-name",
    ModelVersion="model-version",
    OutputConfig={
        "S3OutputLocation": "s3://your-bucket/",
    }
)
```

You can check the status of an edge packaging job using `DescribeEdgePackagingJob` and providing the case-sensitive edge packaging job name:

```
response = sagemaker_client.describe_edge_packaging_job(
    EdgePackagingJobName="edge-packaging-name")
```

This returns a dictionary that can be used to poll the status of the packaging job:

```
# Optional - Poll every 30 sec to check completion status
import time

while True:
    response = sagemaker_client.describe_edge_packaging_job(
        EdgePackagingJobName="edge-packaging-name")

    if response['EdgePackagingJobStatus'] == 'Completed':
        break
    elif response['EdgePackagingJobStatus'] == 'Failed':
        raise RuntimeError('Packaging job failed')
```

```
print('Packaging model... ')
time.sleep(30)
print('Done!')
```

For a list of packaging jobs, use `ListEdgePackagingJobs`. You can use this API to search for a specific packaging job. Provide a partial name to filter packaging job names for `NameContains`, a partial name for `ModelNameContains` to filter for jobs in which the model name contains the name you provide. Also specify with which column to sort with `SortBy`, and by which direction to sort for `SortOrder` (either `Ascending` or `Descending`).

```
sagemaker_client.list_edge_packaging_jobs(
    "NameContains": "sample",
    "ModelNameContains": "sample",
    "SortBy": "column-name",
    "SortOrder": "Descending"
)
```

To stop a packaging job, use `StopEdgePackagingJob` and provide the name of your edge packaging job.

```
sagemaker_client.stop_edge_packaging_job(
    EdgePackagingJobName="edge-packaging-name"
)
```

For a full list of Edge Manager APIs, see the [Boto3 documentation](#).

## Edge Manager Agent

The Edge Manager agent is an inference engine for your edge devices. Use the agent to make predictions with models loaded onto your edge devices. The agent also collects model metrics and captures data at specific intervals. Sample data is stored in your Amazon S3 bucket.

There are two methods of installing and deploying the Edge Manager agent onto your edge devices:

1. Download the agent as a binary from the Amazon S3 release bucket. For more information, see [Download and Set Up Edge Manager Agent Manually \(p. 2113\)](#).
2. Use the Amazon IoT Greengrass V2 console or the Amazon CLI to deploy `aws.greengrass.SageMakerEdgeManager`. See [Create Amazon IoT Greengrass V2 Components \(p. 2119\)](#).

## Download and Set Up Edge Manager Agent Manually

Download the Edge Manager agent based on your operating system, architecture, and your Amazon Region. The agent is periodically updated, so you have the option to choose your agent based on release dates and versions. Once you have the agent, create a JSON configuration file. Specify the device IoT thing name, fleet name, device credentials, and other key-value pairs. See [Running SageMaker Edge Manager Agent \(p. 2115\)](#) for full a list of keys you must specify in the configuration file. You can run the agent as an executable binary or link against it as a Dynamic Shared Object .

### How the Agent Works

The agent runs on the CPU of your devices. The agent runs inference on the framework and hardware of the target device you specified during the compilation job. For example, if you compiled your model for the Jetson Nano, the agent supports the GPU in the provided [Deep Learning Runtime \(DLR\)](#).

The agent is released in binary format for supported operating systems. Check that your operating system is supported and meets the minimum OS requirement in the following table:

Linux

**Version:** Ubuntu 18.04

**Supported Binary Formats:** x86-64 bit (ELF binary) and ARMv8 64 bit (ELF binary)

Windows

**Version:** Windows 10 version 1909

**Supported Binary Formats:** x86-32 bit (DLL) and x86-64 bit (DLL)

## Installing Edge Manager Agent

To use Edge Manager agent, you first must obtain the release artifacts and a Root Certificate. The release artifacts are stored in an Amazon S3 bucket in the us-west-2 Region. To download the artifacts, specify your operating system (<OS>) and the VERSION.

Based on your operating system, replace <os> with one of the following:

Windows 32-bit	Windows 64-bit	Linux x86-64	Linux ARMv8
windows-x86	windows-x64	linux-x64	linux-armv8

The VERSION is broken into three components: <MAJOR\_VERSION>. <YYYY-MM-DD>-<SHA-7>, where:

- **MAJOR\_VERSION:** The release version. The release version is currently set to 1.
- <YYYY-MM-DD>: The time stamp of the artifacts release.
- **SHA-7:** The repository commit ID from which the release is built.

You must provide the MAJOR\_VERSION and the time stamp in <YYYY-MM-DD> format. We suggest you use the latest artifact release time stamp. Use the following to get the latest time stamp.

Run the following in your command line to get the latest time stamp. Replace <os> with your operating system:

```
aws s3 ls s3://sagemaker-edge-release-store-us-west-2-<OS>/Releases/ | sort -r
```

For example, if you have a Windows 32-bit OS, run:

```
aws s3 ls s3://sagemaker-edge-release-store-us-west-2-windows-x86/Releases/ | sort -r
```

This returns:

```
2020-12-01 23:33:36 0
PRE 1.20201218.81f481f/
PRE 1.20201207.02d0e97/
```

The return output in this example shows two release artifacts. The first release artifact file notes that the release version has a major release version of 1, a time stamp of 20201218 (in <YYYY-MM-DD> format), and a 81f481f SHA-7 commit ID.

**Note**

The preceding command assumes you have configured the Amazon Command Line Interface. For more information, about how to configure the settings that the Amazon CLI uses to interact with Amazon, see [Configuring the Amazon CLI](#).

Based on your operating system, use the following commands to install the artifacts:

Windows 32-bit

```
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x86/
Releases/<VERSION>/<VERSION>.zip .
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x86/Releases/<VERSION>/
sha256_hex.shasum .
```

Windows 64-bit

```
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x64/
Releases/<VERSION>/<VERSION>.zip .
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-windows-x64/Releases/<VERSION>/
sha256_hex.shasum .
```

Linux x86-64

```
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/
Releases/<VERSION>/<VERSION>.tgz .
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-x64/Releases/<VERSION>/
sha256_hex.shasum .
```

Linux ARMv8

```
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-armv8/
Releases/<VERSION>/<VERSION>.tgz .
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-linux-armv8/Releases/<VERSION>/
sha256_hex.shasum .
```

You also must download a Root Certificate. This certificate validates model artifacts signed by Amazon before loading them onto your edge devices.

Replace <OS> corresponding to your platform from the list of supported operation systems and replace <REGION> with your Amazon Region.

```
aws s3 cp s3://sagemaker-edge-release-store-us-west-2-<OS>/
Certificates/<REGION>/<REGION>.pem .
```

## Running SageMaker Edge Manager Agent

You can run SageMaker Edge Manager agent can as a standalone process in the form of an Executable and Linkable Format (ELF) executable binary or you can link against it as a Dynamic Shared Object (.dll). Running as a standalone executable binary is the preferred mode and is supported on Linux. Running as a shared object (.dll) is supported on Windows.

On Linux, we recommend that you run the binary via a service that's a part of your initialization (`init`) system. If you want to run the binary directly, you can do so in a terminal as shown in the following example. If you have a modern OS, there are no other installations necessary prior to running the agent, since all the requirements are statically built into the executable. This gives you flexibility to run the agent on the terminal, as a service, or within a container.

To run the agent, first create a JSON configuration file. Specify the following key-value pairs:

- **deviceName** : The name of the device. This device name needs to be registered along with the device fleet in the SageMaker Edge Manager console.
- **deviceFleetName**: The name of the fleet to which the device belongs.
- **region**: The Amazon Region.
- **rootCertsPath**: The absolute folder path to root certificates.
- **provider**: Use "Aws".
- **awsCACertFile**: The absolute path to Amazon Root CA certificate (AmazonRootCA1.pem).
- **awsCertFile**: The absolute path to Amazon IoT signing root certificate (\*.pem.crt).
- **awsCertPKFile**: The absolute path to Amazon IoT private key. (\*.pem.key).
- **awsIoTCredEndpoint**: The Amazon IoT credentials endpoint (*identifier*.iot.*region*.amazonaws.com). See [Connecting devices to Amazon IoT](#) for more information.
- **captureDataDestination**: The destination for uploading capture data. Select either Cloud or Disk.
- **S3BucketName**: The name of your Amazon S3 bucket (not the Amazon S3 bucket URI). The bucket must have a `sagemaker` string within its name.
- **folderPrefix**: The Amazon S3 folder name where you want captured data to upload.
- **captureDataBufferSize**: The capture data buffer size. Integer value.
- **captureDataBatchSize**: The capture data batch size. Integer value.
- **pushPeriodSeconds**: The capture data push period in seconds.
- **base64EmbedLimit**: The limit for uploading capture data in bytes. Integer value.
- **logVerbose** (Optional): Set debug log. Boolean. Select either True or False.

Your configuration file should look similar to the following (with your specific values specified):

```
{
    "sagemaker_edge_core_device_name": "device-name",
    "sagemaker_edge_core_device_fleet_name": "fleet-name",
    "sagemaker_edge_core_region": "region",
    "sagemaker_edge_core_root_certs_path": "<Absolute path to root certificates>",
    "sagemaker_edge_provider_provider": "Aws",
    "sagemaker_edge_provider_aws_ca_cert_file": "<Absolute path to Amazon Root CA certificate>/AmazonRootCA1.pem",
    "sagemaker_edge_provider_aws_cert_file": "<Absolute path to Amazon IoT signing root certificate>/device.pem.crt",
    "sagemaker_edge_provider_aws_cert_pk_file": "<Absolute path to Amazon IoT private key.>/private.pem.key",
    "sagemaker_edge_provider_aws_iot_cred_endpoint": "https://<Amazon IoT Endpoint Address>",
    "sagemaker_edge_core_capture_data_destination": "Cloud",
    "sagemaker_edge_provider_s3_bucket_name": "sagemaker-bucket-name",
    "sagemaker_edge_core_folder_prefix": "Amazon S3 folder prefix",
    "sagemaker_edge_core_capture_data_buffer_size": 30,
    "sagemaker_edge_core_capture_data_batch_size": 10,
    "sagemaker_edge_core_capture_data_push_period_seconds": 4,
    "sagemaker_edge_core_capture_data_base64_embed_limit": 20,
    "sagemaker_edge_log_verbose": false
}
```

Included in the release artifact is a binary executable called `sagemaker_edge_agent_binary` in the `/bin` directory. To run the binary, use the `-a` flag to create a socket file descriptor (.sock) in a directory of your choosing and specify the path of the agent JSON config file you created with the `-c` flag.

```
./sagemaker_edge_agent_binary -a <ADDRESS_TO_SOCKET> -c <PATH_TO_CONFIG_FILE>
```

For example:

```
./sagemaker_edge_agent_binary -a /tmp/sagemaker_edge_agent_example.sock -c sagemaker_edge_config.json
```

In this example, a socket file descriptor named `sagemaker_edge_agent_example.sock` is created in the `/tmp` directory and points to a configuration file that is in the same working directory as the agent called `sagemaker_edge_config.json`.

## Deploy Model Package and Edge Manager Agent with Amazon IoT Greengrass

SageMaker Edge Manager integrates Amazon IoT Greengrass version 2 to simplify accessing, maintaining, and deploying the Edge Manager agent and model to your devices. Without Amazon IoT Greengrass V2, setting up your devices and fleets to use SageMaker Edge Manager requires you to manually copy the Edge Manager agent from an Amazon S3 release bucket. You use the agent to make predictions with models loaded onto your edge devices. With Amazon IoT Greengrass V2 and SageMaker Edge Manager integration, you can now use Amazon IoT Greengrass V2 components. Components are pre-built software modules that can connect your edge devices to Amazon services or third-party service via Amazon IoT Greengrass.

You must install the Amazon IoT Greengrass Core software onto your device(s) if you want to use Amazon IoT Greengrass V2 to deploy the SageMaker Edge Manager agent and your model. For more information about device requirements and how to set up your devices, see [Setting up Amazon IoT Greengrass core devices](#) in the Amazon IoT Greengrass documentation.

You use a pre-built component, an autogenerated component, and a custom component for your Edge Manager application. The public SageMaker Edge Manager component is maintained by SageMaker. The private component is autogenerated when you package your machine learning model with the `createEdgePackagingJob` API and specify "GreengrassV2Component" for the Edge Manager API field `PresetDeploymentType`. The third component is the inference application that is responsible for preprocessing and making inferences on your device. You must create this component. See either [???](#) (p. 2120) in the SageMaker Edge Manager documentation or [Create custom Amazon IoT Greengrass components](#) in the Amazon IoT Greengrass documentation for more information on how to create custom components.

### Prerequisites

SageMaker Edge Manager uses Amazon IoT Greengrass V2 to simplify the deployment of the Edge Manager agent, your machine learning models, and your inference application to your device(s) with the use of components. To make it easier to maintain your Amazon IAM roles, Edge Manager allows you to reuse your existing Amazon IoT role alias. If you do not have one yet, Edge Manager generates a role alias as part of the Edge Manager packaging job. You no longer need to associate a role alias generated from the SageMaker Edge Manager packaging job with your Amazon IoT Role.

Before you start, you must:

1. Install the Amazon IoT Greengrass Core software. For detailed information, see [Install the Amazon IoT Greengrass Core software](#).
2. Set up Amazon IoT Greengrass V2. For more information, see [Install Amazon IoT Greengrass Core software with manual resource provisioning](#).

#### Note

- Make sure the Amazon IoT thing name is all lowercase.
- IAM Role starts with `SageMaker*`

3. Attach the following permission and inline policy to the IAM role created during Amazon IoT Greengrass V2 setup.

- Navigate to the IAM console <https://console.amazonaws.cn/iam/>.
- Search for the role you created by typing in the role name in the **Search** field.
- Choose your role.
- Next, choose **Attach policies**.
- Search for **AmazonSageMakerEdgeDeviceFleetPolicy**.
- Select **AmazonSageMakerFullAccess** (This is an optional step that makes it easier for you to reuse this IAM role in model compilation and packaging).
- Select **Add inline policy**.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "GreengrassComponentAccess",  
            "Effect": "Allow",  
            "Action": [  
                "greengrass>CreateComponentVersion",  
                "greengrassDescribeComponent"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

- Click **Attach policy**.
- Select **Trust relationship**.
- Click **Edit trust relationship**.
- Replace the content with the following.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Principal": {  
                "Service": "credentials.iot.amazonaws.com"  
            },  
            "Action": "sts:AssumeRole"  
        },  
        {  
            "Effect": "Allow",  
            "Principal": {  
                "Service": "sagemaker.amazonaws.com"  
            },  
            "Action": "sts:AssumeRole"  
        }  
    ]  
}
```

4. Create an Edge Manager device fleet. For information on how to create a fleet, see [Set Up Devices and Fleets \(p. 2100\)](#).
5. Register your device with the same name as your Amazon IoT thing name created during the Amazon IoT Greengrass V2 setup.
6. Create at least one custom private Amazon IoT Greengrass component. This component is the application that runs inference on the device. See [Create a Hello World custom component \(p. 2120\)](#)

### Note

- The SageMaker Edge Manager and Amazon IoT Greengrass integration only works for Amazon IoT Greengrass v2.
- Both your Amazon IoT thing name and Edge Manager device name must be the same.
- SageMaker Edge Manager does not load local Amazon IoT certificates and call the Amazon IoT credential provider endpoint directly. Instead, SageMaker Edge Manager uses the Amazon IoT Greengrass v2 TokenExchangeService and it fetches a temporary credential from a TES endpoint.

## Create Amazon IoT Greengrass V2 Components

Amazon IoT Greengrass uses *components*, a software module that is deployed to and runs on a Amazon IoT Greengrass core device. You will need (at a minimum) three components:

1. A public Edge Manager Agent Amazon IoT Greengrass component.
2. A model component that is autogenerated when you package your machine learning model with either the Amazon SDK for Python (Boto3) API or with the SageMaker console.
3. A private, custom component for the inference application.

The Edge Manager Agent Amazon IoT Greengrass component (1) deploys the Edge Manager Agent binary.

The model component (2) is autogenerated when you create an edge packaging job with either the Amazon SDK for Python (Boto3) API or the SageMaker console. For information on how to generate the model component, see [Autogenerated Component \(p. 2119\)](#).

The private custom component (3) is the application that you use to implement the Edge Manager Agent client application, as well as do any preprocessing and post-processing of the inference results. For more information about how to create a custom component, see [Autogenerated Component \(p. 2119\)](#) or [Create custom Amazon IoT Greengrass components](#).

### Autogenerated Component

Generate the model component with the [CreateEdgePackagingJob](#) API and specify `GreengrassV2Component` for the SageMaker Edge Manager packaging job API field `PresetDeploymentType`. When you call the `CreateEdgePackagingJob` API, Edge Manager takes your SageMaker Neo-compiled model in Amazon S3 and creates a model component. The model component is automatically stored in your account. You can view any of your components by navigating to the Amazon IoT console <https://console.amazonaws.cn/iot/>. Select **Greengrass** and then select **Core** devices. The page has a list of Amazon IoT Greengrass core devices associated with your account. If a model component name is not specified in `PresetDeploymentConfig`, the default name generated consists of "SagemakerEdgeManager" and the name of your SageMaker Edge Manager packaging job. The following example demonstrates how to specify Edge Manager to create a Amazon IoT Greengrass V2 component with the `CreateEdgePackagingJob` API.

```
import sagemaker
import boto3

# Create a SageMaker client object to make it easier to interact with other AWS services.
sagemaker_client = boto3('sagemaker', region=<YOUR_REGION>

# Replace with your IAM Role ARN
sagemaker_role_arn="arn:aws:iam::<account>:role/*"

# Replace string with the name of your already created S3 bucket.
bucket='edge-manager-demo-bucket'
```

```
# Specify a name for your edge packaging job.  
edge_packaging_name="edge_packag_job_demo"  
  
# Replace the following string with the name you used for the SageMaker Neo compilation  
# job.  
compilation_job_name="getting-started-demo"  
  
# The name of the model and the model version.  
model_name="sample-model"  
model_version="1.1"  
  
# Output directory in S3 where you want to store the packaged model.  
packaging_output_dir = 'packaged_models'  
packaging_s3_output = 's3://{}{}'.format(bucket, packaging_output_dir)  
  
# The name you want your Greengrass component to have.  
component_name="SagemakerEdgeManager"+edge_packaging_name  
  
sagemaker_client.create_edge_packaging_job(  
    EdgePackagingJobName=edge_packaging_name,  
    CompilationJobName=compilation_job_name,  
    RoleArn=sagemaker_role_arn,  
    ModelName=model_name,  
    ModelVersion=model_version,  
    OutputConfig={  
        "S3OutputLocation": packaging_s3_output,  
        "PresetDeploymentType": "GreengrassV2Component",  
        "PresetDeploymentConfig": {"ComponentName": component_name}  
    }  
)
```

You can also create the autogenerated component with the SageMaker console. Follow steps 1-6 in [Package a Model \(Amazon SageMaker Console\) \(p. 2109\)](#)

Enter the Amazon S3 bucket URI where you want to store the output of the packaging job and optional encryption key.

Complete the following to create the model component:

1. Choose **Preset deployment**.
2. Specify the name of the component for the **Component name** field.
3. Optionally, provide a description of the component, a component version, the platform OS, or the platform architecture for the **Component description**, **Component version**, **Platform OS**, and **Platform architecture**, respectively.
4. Choose **Submit**.

### Create a Hello World custom component

The custom application component is used to perform inference on the edge device. The component is responsible for loading models to SageMaker Edge Manager, invoking the Edge Manager agent for inference, and unloading the model when the component is shut down. Before you create your component, ensure the agent and application can communicate with SageMaker Edge Manager. To do this, configure gRPC. The SageMaker Edge Manager agent uses methods defined in Protobuf Buffers and the gRPC server to establish communication with the client application on the edge device and the cloud.

To use gRPC, you must:

1. Create a gRPC stub using the .proto file provided when you download the Edge Manager agent from Amazon S3 release bucket.
2. Write client code with the language you prefer.

You do not need to define the service in a .proto file (1). The service .proto files are included in the compressed TAR file when you download the SageMaker Edge Manager agent release binary from the Amazon S3 release bucket.

Install gRPC and other necessary tools on your host machine and create gRPC stubs `agent_pb2_grpc.py` and `agent_pb2.py` in Python. Make sure you have `agent.proto` in your local directory.

```
%%bash
pip install grpcio
pip install grpcio-tools
python3 -m grpc_tools.protoc --proto_path=. --python_out=. --grpc_python_out=. agent.proto
```

The preceding code generates the gRPC client and server interfaces from your .proto service definition (2). In other words, it creates the gRPC model in Python. The API folder contains the Protobuf specification for communicating with the agent.

Next, use the gRPC API to write a client and server for your service (2). The following example script, `edge_manager_python_example.py`, uses Python to load, list, and unload a yolov3 model to the edge device.

```
import grpc
from PIL import Image
import agent_pb2
import agent_pb2_grpc
import os

model_path = '<PATH-TO-SagemakerEdgeManager-COMPONENT>'

agent_socket = 'unix:///tmp/aws.greengrass.SageMakerEdgeManager.sock'
agent_channel = grpc.insecure_channel(agent_socket, options=(('grpc.enable_http_proxy', 0),))
agent_client = agent_pb2_grpc.AgentStub(agent_channel)

def list_models():
    return agent_client.ListModels(agent_pb2.ListModelsRequest())

def list_model_tensors(models):
    return [
        model.name: {
            'inputs': model.input_tensor_metadata,
            'outputs': model.output_tensor_metadata
        }
        for model in list_models().models
    ]

def load_model(model_name, model_path):
    load_request = agent_pb2.LoadModelRequest()
    load_request.url = model_path
    load_request.name = model_name
    return agent_client.LoadModel(load_request)

def unload_model(name):
    unload_request = agent_pb2.UnLoadModelRequest()
    unload_request.name = name
    return agent_client.UnLoadModel(unload_request)
```

```

def predict_image(model_name, image_path):
    image_tensor = agent_pb2.Tensor()
    image_tensor.byte_data = Image.open(image_path).tobytes()
    image_tensor_metadata = list_model_tensors(list_models())[model_name]['inputs'][0]
    image_tensor.tensor_metadata.name = image_tensor_metadata.name
    image_tensor.tensor_metadata.data_type = image_tensor_metadata.data_type
    for shape in image_tensor_metadata.shape:
        image_tensor.tensor_metadata.shape.append(shape)
    predict_request = agent_pb2.PredictRequest()
    predict_request.name = model_name
    predict_request.tensors.append(image_tensor)
    predict_response = agent_client.Predict(predict_request)
    return predict_response

def main():
    try:
        unload_model('your-model')
    except:
        pass

    print('LoadModel...', end='')
    try:
        load_model('your-model', model_path)
        print('done.')
    except Exception as e:
        print()
        print(e)
        print('Model already loaded!')

    print('ListModels...', end='')
    try:
        print(list_models())
        print('done.')
    except Exception as e:
        print()
        print(e)
        print('List model failed!')

    print('Unload model...', end='')
    try:
        unload_model('your-model')
        print('done.')
    except Exception as e:
        print()
        print(e)
        print('unload model failed!')

if __name__ == '__main__':
    main()

```

Ensure `model_path` points to the name of the Amazon IoT Greengrass component containing the model if you use the same client code example.

You can create your Amazon IoT Greengrass V2 Hello World component once you have generated your gRPC stubs and you have your Hello World code ready. To do so:

- Upload your `edge_manager_python_example.py`, `agent_pb2_grpc.py`, and `agent_pb2.py` to your Amazon S3 bucket and note down their Amazon S3 path.
- Create a private component in the Amazon IoT Greengrass V2 console and define the recipe for your component. Specify the Amazon S3 URI to your Hello World application and gRPC stub in the following recipe.

```
---  
RecipeFormatVersion: 2020-01-25  
ComponentName: com.sagemaker.edgePythonExample  
ComponentVersion: 1.0.0  
ComponentDescription: Sagemaker Edge Manager Python example  
ComponentPublisher: Amazon Web Services, Inc.  
ComponentDependencies:  
    aws.greengrass.SageMakerEdgeManager:  
        VersionRequirement: '>=1.0.0'  
        DependencyType: HARD  
Manifests:  
    - Platform:  
        os: linux  
        architecture: "/amd64|x86/"  
Lifecycle:  
    install: |-  
        apt-get install python3-pip  
        pip3 install grpcio  
        pip3 install grpcio-tools  
        pip3 install protobuf  
        pip3 install Pillow  
    run:  
        script: |-  
            python3 {{artifacts:path}}/edge_manager_python_example.py  
Artifacts:  
    - URI: <code-s3-path>  
    - URI: <pb2-s3-path>  
    - URI: <pb2-grpc-s3-path>
```

For detailed information about creating a Hello World recipe, see [Create your first component](#) in the Amazon IoT Greengrass documentation.

## Deploy Components to Your Device

Deploy your components with the Amazon IoT console or with the Amazon CLI.

### To deploy your components (console)

Deploy your Amazon IoT Greengrass components with the Amazon IoT console.

1. In the Amazon IoT Greengrass console at <https://console.amazonaws.cn/iot/> navigation menu, choose **Deployments**.
2. On the **Components** page, on the **Public components** tab, choose `aws.greengrass.SageMakerEdgeManager`.
3. On the `aws.greengrass.SageMakerEdgeManager` page, choose **Deploy**.
4. From **Add to deployment**, choose one of the following:
  - a. To merge this component to an existing deployment on your target device, choose **Add to existing deployment**, and then select the deployment that you want to revise.
  - b. To create a new deployment on your target device, choose **Create new deployment**. If you have an existing deployment on your device, choosing this step replaces the existing deployment.
5. On the **Specify target** page, do the following:
  - a. Under **Deployment information**, enter or modify the friendly name for your deployment.
  - b. Under **Deployment targets**, select a target for your deployment, and choose **Next**. You cannot change the deployment target if you are revising an existing deployment.
6. On the **Select components** page, under **My components**, choose:
  - com.<CUSTOM-COMPONENT-NAME>

- `aws.greengrass.SageMakerEdgeManager`
  - `SagemakerEdgeManager.<YOUR-PACKAGING-JOB>`
7. On the **Configure components** page, choose `com.greengrass.SageMakerEdgeManager`, and do the following.
    - a. Choose **Configure component**.
    - b. Under **Configuration update**, in **Configuration to merge**, enter the following configuration.

```
{
  "DeviceFleetName": "device-fleet-name",
  "BucketName": "DOC-EXAMPLE-BUCKET"
}
```

Replace `device-fleet-name` with the name of the edge device fleet that you created, and replace `DOC-EXAMPLE-BUCKET` with the name of the Amazon S3 bucket that is associated with your device fleet.

- c. Choose **Confirm**, and then choose **Next**.
8. On the **Configure advanced settings** page, keep the default configuration settings, and choose **Next**.
9. On the **Review** page, choose **Deploy**.

### To deploy your components (Amazon CLI)

1. Create a `deployment.json` file to define the deployment configuration for your SageMaker Edge Manager components. This file should look like the following example.

```
{
  "targetArn": "targetArn",
  "components": {
    "aws.greengrass.SageMakerEdgeManager": {
      "componentVersion": "1.0.0",
      "configurationUpdate": {
        "merge": {
          "DeviceFleetName": "device-fleet-name",
          "BucketName": "DOC-EXAMPLE-BUCKET"
        }
      }
    },
    "com.greengrass.SageMakerEdgeManager.ImageClassification": {
      "componentVersion": "1.0.0",
      "configurationUpdate": {}
    },
    "com.greengrass.SageMakerEdgeManager.ImageClassification.Model": {
      "componentVersion": "1.0.0",
      "configurationUpdate": {}
    }
  }
}
```

- In the `targetArn` field, replace `targetArn` with the Amazon Resource Name (ARN) of the thing or thing group to target for the deployment, in the following format:
  - Thing: `arn:aws:iot:<region>:<account-id>:thing/<thingName>`
  - Thing group: `arn:aws:iot:<region>:<account-id>:thinggroup/<thingGroupName>`
- In the `merge` field, replace `device-fleet-name` with the name of the edge device fleet that you created, and replace `DOC-EXAMPLE-BUCKET` with the name of the Amazon S3 bucket that is associated with your device fleet.

- Replace the component versions for each component with the latest available version.
2. Run the following command to deploy the components on the device:

```
$ aws greengrassv2 create-deployment \
--cli-input-json file://path/to/deployment.json
```

The deployment can take several minutes to complete. In the next step, check the component log to verify that the deployment completed successfully and to view the inference results.

For more information about deploying components to individual devices or groups of devices, see [Deploy Amazon IoT Greengrass components to devices](#).

## Manage Model

The Edge Manager agent can load multiple models at a time and make inference with loaded models on edge devices. The number of models the agent can load is determined by the available memory on the device. The agent validates the model signature and loads into memory all the artifacts produced by the edge packaging job. This step requires all the required certificates described in previous steps to be installed along with rest of the binary installation. If the model's signature cannot be validated, then loading of the model fails with appropriate return code and reason.

SageMaker Edge Manager agent provides a list of Model Management APIs that implement control plane and data plane APIs on edge devices. Along with this documentation, we recommend going through the sample client implementation which shows canonical usage of the below described APIs.

The `proto` file is available as a part of the release artifacts (inside the release tarball). In this doc, we list and describe the usage of APIs listed in this `proto` file.

### Note

There is one-to-one mapping for these APIs on Windows release and a sample code for an application implement in C# is shared with the release artifacts for Windows. Below instructions are for running the Agent as a standalone process, applicable for to the release artifacts for Linux.

Extract the archive based on your OS. Where `VERSION` is broken into three components: `<MAJOR_VERSION>. <YYYY-MM-DD>-<SHA-7>`. See [Installing Edge Manager Agent \(p. 2114\)](#) for information on how to obtain the release version (`<MAJOR_VERSION>`), time stamp of the release artifact (`<YYYY-MM-DD>`), and the repository commit ID (`SHA-7`)

### Linux

The zip archive can be extracted with the command:

```
tar -xvzf <VERSION>.tgz
```

### Windows

The zip archive can be extracted with the UI or command:

```
unzip <VERSION>.tgz
```

The release artifact hierarchy (after extracting the `tar/zip` archive) is shown below. The agent `proto` file is available under `api/`.

```
0.20201205.7ee4b0b
### bin

## Load Model

The Edge Manager agent supports loading multiple models. This API validates the model signature and loads into memory all the artifacts produced by the `EdgePackagingJob` operation. This step requires all the required certificates to be installed along with rest of the agent binary installation. If the model's signature cannot be validated then this step fails with appropriate return code and error messages in the log.

```

// perform load for a model
// Note:
// 1. currently only local filesystem paths are supported for loading models.
// 2. multiple models can be loaded at the same time, as limited by available device memory
// 3. users are required to unload any loaded model to load another model.
// Status Codes:
// 1. OK - load is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - model doesn't exist at the url
// 5. ALREADY_EXISTS - model with the same name is already loaded
// 6. RESOURCE_EXHAUSTED - memory is not available to load the model
// 7. FAILED_PRECONDITION - model is not compiled for the machine.
//
rpc LoadModel(LoadModelRequest) returns (LoadModelResponse);

```

### Input

```

// 
// request for LoadModel rpc call
// 

```

```
message LoadModelRequest {
    string url = 1;
    string name = 2; // Model name needs to match regex "^[a-zA-Z0-9](-*[a-zA-Z0-9])*$"
}
```

#### Output

```
//
// response for LoadModel rpc call
//
message LoadModelResponse {
    Model model = 1;
}

//
// Model represents the metadata of a model
// url - url representing the path of the model
// name - name of model
// input_tensor_metadata - TensorMetadata array for the input tensors
// output_tensor_metadata - TensorMetadata array for the output tensors
//
// Note:
// 1. input and output tensor metadata could empty for dynamic models.
//
message Model {
    string url = 1;
    string name = 2;
    repeated TensorMetadata input_tensor_metadata = 3;
    repeated TensorMetadata output_tensor_metadata = 4;
}
```

## Unload Model

Unloads a previously loaded model. It is identified via the model alias which was provided during `loadModel`. If the alias is not found or model is not loaded then returns error.

```
//
// perform unload for a model
// Status Codes:
// 1. OK - unload is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - model doesn't exist
//
rpc UnLoadModel(UnLoadModelRequest) returns (UnLoadModelResponse);
```

#### Input

```
//
// request for UnLoadModel rpc call
//
message UnLoadModelRequest {
    string name = 1; // Model name needs to match regex "^[a-zA-Z0-9](-*[a-zA-Z0-9])*$"
}
```

#### Output

```
//
```

```
// response for UnLoadModel rpc call
//
message UnLoadModelResponse {}
```

## List Models

Lists all the loaded models and their aliases.

```
//
// lists the loaded models
// Status Codes:
// 1. OK - unload is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
//
rpc ListModels(ListModelsRequest) returns (ListModelsResponse);
```

### Input

```
//
// request for ListModels rpc call
//
message ListModelsRequest {}
```

### Output

```
//
// response for ListModels rpc call
//
message ListModelsResponse {
    repeated Model models = 1;
}
```

## Describe Model

Describes a model that is loaded on the agent.

```
//
// Status Codes:
// 1. OK - load is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - model doesn't exist at the url
//
rpc DescribeModel(DescribeModelRequest) returns (DescribeModelResponse);
```

### Input

```
//
// request for DescribeModel rpc call
//
message DescribeModelRequest {
    string name = 1;
}
```

### Output

```

//  

// response for DescribeModel rpc call  

//  

message DescribeModelResponse {  

    Model model = 1;  

}

```

## Capture Data

Allows the client application to capture input and output tensors in Amazon S3 bucket, and optionally the auxiliary. The client application is expected to pass a unique capture ID along with each call to this API. This can be later used to query status of the capture.

```

//  

// allows users to capture input and output tensors along with auxiliary data.  

// Status Codes:  

// 1. OK - data capture successfully initiated  

// 2. UNKNOWN - unknown error has occurred  

// 3. INTERNAL - an internal error has occurred  

// 5. ALREADY_EXISTS - capture initiated for the given capture_id  

// 6. RESOURCE_EXHAUSTED - buffer is full cannot accept any more requests.  

// 7. OUT_OF_RANGE - timestamp is in the future.  

// 8. INVALID_ARGUMENT - capture_id is not of expected format.  

//  

rpc CaptureData(CaptureDataRequest) returns (CaptureDataResponse);

```

### Input

```

enum Encoding {  

    CSV = 0;  

    JSON = 1;  

    NONE = 2;  

    BASE64 = 3;  

}  

//  

// AuxillaryData represents a payload of extra data to be capture along with inputs and  

// outputs of inference  

// encoding - supports the encoding of the data  

// data - represents the data of shared memory, this could be passed in two ways:  

// a. send across the raw bytes of the multi-dimensional tensor array  

// b. send a SharedMemoryHandle which contains the posix shared memory segment id and  

// offset in bytes to location of multi-dimensional tensor array.  

//  

message AuxillaryData {  

    string name = 1;  

    Encoding encoding = 2;  

    oneof data {  

        bytes byte_data = 3;  

        SharedMemoryHandle shared_memory_handle = 4;  

    }  

}  

//  

// Tensor represents a tensor, encoded as contiguous multi-dimensional array.  

// tensor_metadata - represents metadata of the shared memory segment  

// data_or_handle - represents the data of shared memory, this could be passed in two  

// ways:

```

```
// a. send across the raw bytes of the multi-dimensional tensor array
// b. send a SharedMemoryHandle which contains the posix shared memory segment
// id and offset in bytes to location of multi-dimensional tensor array.
//
message Tensor {
    TensorMetadata tensor_metadata = 1; //optional in the predict request
    oneof data {
        bytes byte_data = 4;
        // will only be used for input tensors
        SharedMemoryHandle shared_memory_handle = 5;
    }
}

//
// request for CaptureData rpc call
//
message CaptureDataRequest {
    string model_name = 1;
    string capture_id = 2; //uuid string
    Timestamp inference_timestamp = 3;
    repeated Tensor input_tensors = 4;
    repeated Tensor output_tensors = 5;
    repeated AuxiliaryData inputs = 6;
    repeated AuxiliaryData outputs = 7;
}
```

#### Output

```
//
// response for CaptureData rpc call
//
message CaptureDataResponse {}
```

## Get Capture Status

Depending on the models loaded the input and output tensors can be large (for many edge devices). Capture to the cloud can be time consuming. So the `CaptureData()` is implemented as an asynchronous operation. A capture ID is a unique identifier that the client provides during capture data call, this ID can be used to query the status of the asynchronous call.

```
//
// allows users to query status of capture data operation
// Status Codes:
// 1. OK - data capture successfully initiated
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - given capture id doesn't exist.
//
rpc GetCaptureDataStatus(GetCaptureDataStatusRequest) returns
    (GetCaptureDataStatusResponse);
```

#### Input

```
//
// request for GetCaptureDataStatus rpc call
//
message GetCaptureDataStatusRequest {
    string capture_id = 1;
}
```

## Output

```

enum CaptureDataStatus {
    FAILURE = 0;
    SUCCESS = 1;
    IN_PROGRESS = 2;
    NOT_FOUND = 3;
}

//
// response for GetCaptureDataStatus rpc call
//
message GetCaptureDataStatusResponse {
    CaptureDataStatus status = 1;
}

```

## Predict

The predict API performs inference on a previously loaded model. It accepts a request in the form of a tensor that is directly fed into the neural network. The output is the output tensor (or scalar) from the model. This is a blocking call.

```

//
// perform inference on a model.
//
// Note:
// 1. users can chose to send the tensor data in the protobuf message or
// through a shared memory segment on a per tensor basis, the Predict
// method will handle the decode transparently.
// 2. serializing large tensors into the protobuf message can be quite expensive,
// based on our measurements it is recommended to use shared memory of
// tenors larger than 256KB.
// 3. SMEdge IPC server will not use shared memory for returning output tensors,
// i.e., the output tensor data will always send in byte form encoded
// in the tensors of PredictResponse.
// 4. currently SMEdge IPC server cannot handle concurrent predict calls, all
// these call will be serialized under the hood. this shall be addressed
// in a later release.
// Status Codes:
// 1. OK - prediction is successful
// 2. UNKNOWN - unknown error has occurred
// 3. INTERNAL - an internal error has occurred
// 4. NOT_FOUND - when model not found
// 5. INVALID_ARGUMENT - when tenors types mismatch
//
rpc Predict(PredictRequest) returns (PredictResponse);

```

## Input

```

// request for Predict rpc call
//
message PredictRequest {
    string name = 1;
    repeated Tensor tensors = 2;
}

//
// Tensor represents a tensor, encoded as contiguous multi-dimensional array.
//     tensor_metadata - represents metadata of the shared memory segment
//     data_or_handle - represents the data of shared memory, this could be passed in
// two ways:

```

```

//                                     a. send across the raw bytes of the multi-dimensional tensor
array
//                                     b. send a SharedMemoryHandle which contains the posix shared
memory segment
//                                         id and offset in bytes to location of multi-dimensional
tensor array.
//
message Tensor {
    TensorMetadata tensor_metadata = 1; //optional in the predict request
    oneof data {
        bytes byte_data = 4;
        // will only be used for input tensors
        SharedMemoryHandle shared_memory_handle = 5;
    }
}

//
// Tensor represents a tensor, encoded as contiguous multi-dimensional array.
//   tensor_metadata - represents metadata of the shared memory segment
//   data_or_handle - represents the data of shared memory, this could be passed in
two ways:
//                                     a. send across the raw bytes of the multi-dimensional tensor
array
//                                     b. send a SharedMemoryHandle which contains the posix shared
memory segment
//                                         id and offset in bytes to location of multi-dimensional
tensor array.
//
message Tensor {
    TensorMetadata tensor_metadata = 1; //optional in the predict request
    oneof data {
        bytes byte_data = 4;
        // will only be used for input tensors
        SharedMemoryHandle shared_memory_handle = 5;
    }
}

//
// TensorMetadata represents the metadata for a tensor
//   name - name of the tensor
//   data_type - data type of the tensor
//   shape - array of dimensions of the tensor
//
message TensorMetadata {
    string name = 1;
    DataType data_type = 2;
    repeated int32 shape = 3;
}

//
// SharedMemoryHandle represents a posix shared memory segment
//   offset - offset in bytes from the start of the shared memory segment.
//   segment_id - shared memory segment id corresponding to the posix shared memory
segment.
//   size - size in bytes of shared memory segment to use from the offset position.
//
message SharedMemoryHandle {
    uint64 size = 1;
    uint64 offset = 2;
    uint64 segment_id = 3;
}

```

## Output

### Note

The `PredictResponse` only returns `Tensors` and not `SharedMemoryHandle`.

```
// response for Predict rpc call
//
message PredictResponse {
    repeated Tensor tensors = 1;
}
```

# Using Docker containers with SageMaker

Amazon SageMaker makes extensive use of *Docker containers* for build and runtime tasks. SageMaker provides prebuilt Docker images for its built-in algorithms and the supported deep learning frameworks used for training and inference. Using containers, you can train machine learning algorithms and deploy models quickly and reliably at any scale. The topics in this section show how to deploy these containers for your own use cases.

## Topics

- [Scenarios for Running Scripts, Training Algorithms, or Deploying Models with SageMaker \(p. 2134\)](#)
- [Docker Container Basics \(p. 2135\)](#)
- [Use Prebuilt SageMaker Docker images \(p. 2135\)](#)
- [Adapting Your Own Docker Container to Work with SageMaker \(p. 2148\)](#)
- [Create a container with your own algorithms and models \(p. 2160\)](#)
- [Example Notebooks: Use Your Own Algorithm or Model \(p. 2175\)](#)
- [Troubleshooting your Docker containers \(p. 2177\)](#)

## Scenarios for Running Scripts, Training Algorithms, or Deploying Models with SageMaker

Amazon SageMaker always uses Docker containers when running scripts, training algorithms, and deploying models. However, your level of engagement with containers depends on your use case.

- **Use a built-in SageMaker algorithm or framework.** For most use cases, you can use the built-in algorithms and frameworks without worrying about containers. You can train and deploy these algorithms from the SageMaker console, the Amazon Command Line Interface (Amazon CLI), a Python notebook, or the [Amazon SageMaker Python SDK](#) by specifying the algorithm or framework version when creating your Estimator. The built-in algorithms available are itemized and described in the [Use Amazon SageMaker Built-in Algorithms \(p. 718\)](#) topic. For more information on the available frameworks, see [ML Frameworks and Toolkits \(p. 16\)](#). For an example of how to train and deploy a built-in algorithm using a Jupyter notebook running in a SageMaker notebook instance, see the [Get Started with Amazon SageMaker \(p. 34\)](#) topic.
- **Use prebuilt SageMaker container images.** Alternatively, you can use the built-in algorithms and frameworks using Docker containers. SageMaker provides containers for its built-in algorithms and prebuilt Docker images for some of the most common machine learning frameworks, such as Apache MXNet, TensorFlow, PyTorch, and Chainer. For a full list of the available SageMaker Images, see [Available Deep Learning Containers Images](#). It also supports machine learning libraries such as scikit-learn and SparkML. If you use the [Amazon SageMaker Python SDK](#), you can deploy the containers by passing the full container URI to their respective SageMaker SDK Estimator class. For the full list of deep learning frameworks currently supported by SageMaker, see [Prebuilt SageMaker Docker Images for Deep Learning \(p. 2135\)](#). For information on the scikit-learn and SparkML prebuilt container images, see [Prebuilt Amazon SageMaker Docker Images for Scikit-learn and Spark ML \(p. 2136\)](#). For more information about using frameworks with the [Amazon SageMaker Python SDK](#), see their respective topics in [Use Machine Learning Frameworks, Python, and R with Amazon SageMaker \(p. 16\)](#).
- **Extend a prebuilt SageMaker container image.** If you would like to extend a prebuilt SageMaker algorithm or model Docker image, you can modify the SageMaker image to satisfy your needs. For an example, see [Extending our PyTorch containers](#).

- **Adapt an existing container image:** If you would like to adapt a pre-existing container image to work with SageMaker, you need to modify the Docker container to enable either the SageMaker Training or Inference toolkit. For an example that shows how to build your own containers to train and host an algorithm, see [Bring Your Own R Algorithm](#).

## Docker Container Basics

Docker is a program that performs operating system-level virtualization for installing, distributing, and managing software. It packages applications and their dependencies into virtual containers that provide isolation, portability, and security. With Docker, you can ship code faster, standardize application operations, seamlessly move code, and economize by improving resource utilization. For more general information about Docker, see [Docker overview](#).

The following information outlines the most significant aspects of using Docker containers with Amazon SageMaker.

### SageMaker Functions

SageMaker uses Docker containers in the backend to manage training and inference processes. SageMaker abstracts away from this process, so it happens automatically when an estimator is used. While you don't need to use Docker containers explicitly with SageMaker for most use cases, you can use Docker containers to extend and customize SageMaker functionality.

### Containers with SageMaker Studio

SageMaker Studio runs from a Docker container and uses it to manage functionality. As a result, you cannot create and upload a Docker container from a SageMaker Studio instance. However, you can use a prebuilt SageMaker container as long as that container was created outside of Studio.

## Use Prebuilt SageMaker Docker images

Amazon SageMaker provides containers for its built-in algorithms and prebuilt Docker images for some of the most common machine learning frameworks, such as Apache MXNet, TensorFlow, PyTorch, and Chainer. It also supports machine learning libraries such as scikit-learn and SparkML.

You can use these images from your SageMaker notebook instance or SageMaker Studio. You can also extend the prebuilt SageMaker images to include libraries and needed functionality. The following topics give information about the available images and how to use them.

### Note

For information on Docker images for developing reinforcement learning (RL) solutions in SageMaker, see [SageMaker RL Containers](#).

### Topics

- [Prebuilt SageMaker Docker Images for Deep Learning \(p. 2135\)](#)
- [Prebuilt Amazon SageMaker Docker Images for Scikit-learn and Spark ML \(p. 2136\)](#)
- [Train a Deep Graph Network \(p. 2138\)](#)
- [Extend a Prebuilt Container \(p. 2140\)](#)

## Prebuilt SageMaker Docker Images for Deep Learning

SageMaker provides prebuilt Docker images that include deep learning framework libraries and other dependencies needed for training and inference. For a complete list of the available pre-built Docker images, see [Deep Learning Containers Images](#).

If you are not using the [Amazon SageMaker Python SDK](#) and one of its estimators to retrieve the pre-built images, you have to retrieve them yourself.

## Using the SageMaker Python SDK

With the [SageMaker Python SDK](#), you can train and deploy models using these popular deep learning frameworks. For instructions on installing and using the SDK, see [Amazon SageMaker Python SDK](#). The following table lists the available frameworks and instructions on how to use them with the [SageMaker Python SDK](#):

Framework	Instructions
TensorFlow	<a href="#">Using TensorFlow with the SageMaker Python SDK</a>
MXNet	<a href="#">Using MXNet with the SageMaker Python SDK</a>
PyTorch	<a href="#">Using PyTorch with the SageMaker Python SDK</a>
Chainer	<a href="#">Using Chainer with the SageMaker Python SDK</a>
Hugging Face	<a href="#">Using Hugging Face with the SageMaker Python SDK</a>

## Extending Prebuilt SageMaker Docker Images

You can customize these prebuilt containers or extend them to handle any additional functional requirements for your algorithm or model that the prebuilt SageMaker Docker image doesn't support. For an example, see [Extending Our PyTorch Containers](#).

You can also use prebuilt containers to deploy your custom models or models that have been trained in a framework other than SageMaker. For an overview of the process of bringing the trained model artifacts into SageMaker and hosting them at an endpoint, see [Bring Your Own Pretrained MXNet or TensorFlow Models into Amazon SageMaker](#).

## Prebuilt Amazon SageMaker Docker Images for Scikit-learn and Spark ML

SageMaker provides prebuilt Docker images that install the scikit-learn and Spark ML libraries. These libraries also include the dependencies needed to build Docker images that are compatible with SageMaker using the [Amazon SageMaker Python SDK](#). With the SDK, you can use scikit-learn for machine learning tasks and use Spark ML to create and tune machine learning pipelines. For instructions on installing and using the SDK, see [SageMaker Python SDK](#).

## Using the SageMaker Python SDK

The following table contains links to the GitHub repositories with the source code for the scikit-learn and Spark ML containers. The table also contains links to instructions that show how use these containers with Python SDK estimators to run your own training algorithms and hosting your own models.

Library	Prebuilt Docker Image Source Code	Instructions
scikit-learn	<a href="#">SageMaker Scikit-learn Containers</a>	<a href="#">Using Scikit-learn with the Amazon SageMaker Python SDK</a>
Spark ML	<a href="#">SageMaker Spark ML Serving Containers</a>	<a href="#">SparkML Python SDK Documentation</a>

## Specifying the Prebuilt Images Manually

If you are not using the SageMaker Python SDK and one of its estimators to manage the container, you have to retrieve the relevant prebuilt container manually. The SageMaker prebuilt Docker images are stored in Amazon Elastic Container Registry (Amazon ECR). You can push or pull them using their fullname registry addresses. SageMaker uses the following Docker Image URL patterns for scikit-learn and Spark M:

- <ACCOUNT\_ID>.dkr.ecr.<REGION\_NAME>.amazonaws.com/sagemaker-scikit-learn:<SCIKIT-LEARN\_VERSION>-cpu-py<PYTHON\_VERSION>

For example, `746614075791.dkr.ecr.us-west-1.amazonaws.com/sagemaker-scikit-learn:0.23-1-cpu-py3`

- <ACCOUNT\_ID>.dkr.ecr.<REGION\_NAME>.amazonaws.com/sagemaker-sparkml-serving:<SPARK-ML\_VERSION>

For example, `341280168497.dkr.ecr.ca-central-1.amazonaws.com/sagemaker-sparkml-serving:2.4`

The following table lists the supported values for account IDs and corresponding Amazon Region names.

ACCOUNT_ID	REGION_NAME
746614075791	us-west-1
246618743249	us-west-2
683313688378	us-east-1
257758044811	us-east-2
354813040037	ap-northeast-1
366743142698	ap-northeast-2
121021644041	ap-southeast-1
783357654285	ap-southeast-2
720646828776	ap-south-1
141502667606	eu-west-1
764974769150	eu-west-2
492215442770	eu-central-1
341280168497	ca-central-1
414596584902	us-gov-west-1

## Finding Available Images

Use the following commands to find out which versions of the images are available. For example, use the following to find the available sagemaker-sparkml-serving image in the ca-central-1 Region:

```
aws \
```

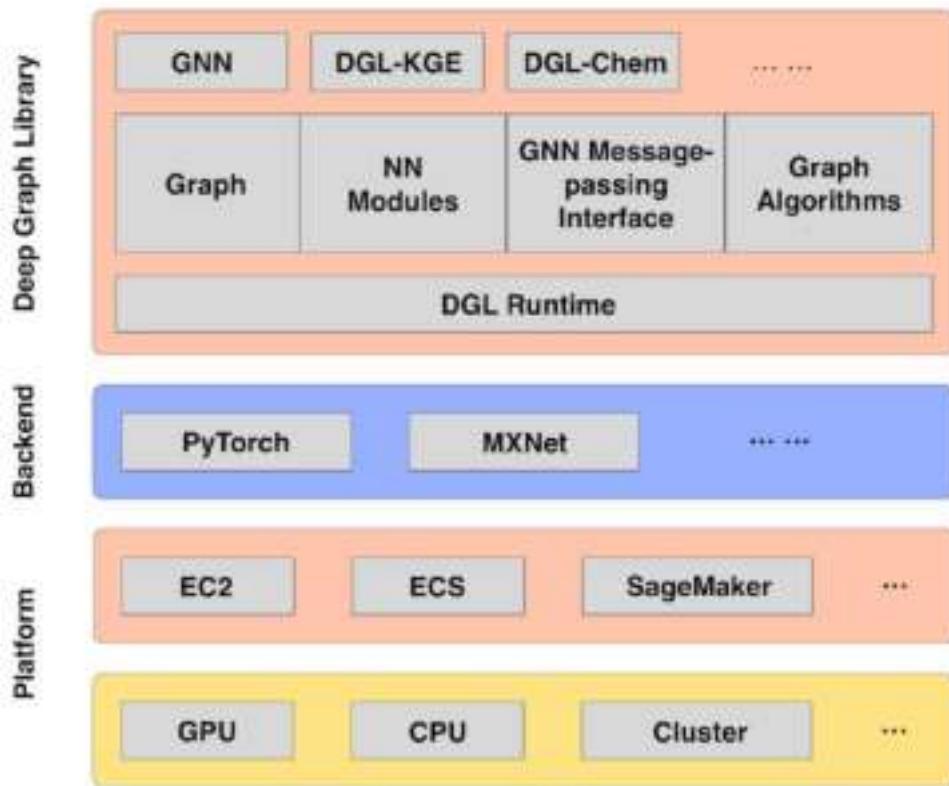

```
ecr describe-images \
--region ca-central-1 \
--repository-id 341280168497 \
--repository-name sagemaker-sparkml-serving
```

## Train a Deep Graph Network

In this overview, you learn how to get started with a deep graph network by using one of the DGL containers in Amazon Elastic Container Registry (Amazon ECR). You can also see links to practical examples for deep graph networks.

### What Is a Deep Graph Network?

Deep graph networks refer to a type of neural network that is trained to solve graph problems. A deep graph network uses an underlying deep learning framework like PyTorch or MXNet. The potential for graph networks in practical AI applications is highlighted in the Amazon SageMaker tutorials for [Deep Graph Library](#) (DGL). Examples for training models on graph datasets include social networks, knowledge bases, biology, and chemistry.

*Figure 1. The DGL ecosystem*

Several examples are provided using Amazon SageMaker's deep learning containers that are preconfigured with DGL. If you have special modules you want to use with DGL, you can also build your own container. The examples involve heterographs, which are graphs that have multiple types of nodes and edges, and draw on a variety of applications across disparate scientific fields, such as bioinformatics and social network analysis. DGL provides a wide array of [graph neural network implementations for different types models](#). Some of the highlights include:

- Graph convolutional network (GCN)
- Relational graph convolutional network (R-GCN)
- Graph attention network (GAT)
- Deep generative models of graphs (DGMG)
- Junction tree neural network (JTNN)

## Get Started

DGL is available as a deep learning container in Amazon ECR. You can select deep learning containers when you write your estimator function in an Amazon SageMaker notebook. You can also craft your own custom container with DGL by following the [Bring Your Own Container](#) guide. The easiest way to get started with a deep graph network uses one of the DGL containers in Amazon ECR.

### Note

Backend framework support is limited to PyTorch and MXNet.

### Setup

If you are using Amazon SageMaker Studio, you need to clone the examples repository first. If you are using a notebook instance, you can find the examples by choosing the SageMaker icon at bottom of the left toolbar.

### To clone the Amazon SageMaker SDK and notebook examples repository

1. From the **JupyterLab** view in Amazon SageMaker, go to the **File Browser** at the top of the left toolbar. From the **File Browser panel**, you can see a new navigation at the top of the panel.
2. Choose the icon on the far right to clone a Git repository.
3. Add the repository URL: <https://github.com/awslabs/amazon-sagemaker-examples.git>
4. Browse the newly added folder and its contents. The DGL examples are stored in the **sagemaker-python-sdk** folder.

## Run a Graph Network Training Example

### To train a deep graph network

1. From the **JupyterLab** view in Amazon SageMaker, browse the [example notebooks](#) and look for DGL folders. Several files may be included to support an example. Examine the README for any prerequisites.
2. Run the .ipynb notebook example.
3. Find the estimator function, and note the line where it is using an Amazon ECR container for DGL and a specific instance type. You may want to update this to use a container in your preferred Region.
4. Run the function to launch the instance and use the DGL container for training a graph network. Charges are incurred for launching this instance. The instance self-terminates when the training is complete.

## Examples

An example of knowledge graph embedding (KGE) is provided. It uses the Freebase dataset, a knowledge base of general facts. An example use case would be to graph the relationships of persons and predict their nationality.

An example implementation of a graph convolutional network (GCN) shows how you can train a graph network to predict toxicity. A physiology dataset, Tox21, provides toxicity measurements for how substances affect biological responses.

Another GCN example shows you how to train a graph network on a scientific publications bibliography dataset, known as Cora. You can use it to find relationships between authors, topics, and conferences.

The last example is a recommender system for movie reviews. It uses a graph convolutional matrix completion (GCMC) network trained on the MovieLens datasets. These datasets consist of movie titles, genres, and ratings by users.

## Use a Deep Learning Container with DGL

The following examples use preconfigured deep learning containers. These are the easiest to try since they work out of the box on Amazon SageMaker.

- [Semi-supervised classification of a knowledge base using a GCN](#)
- [Learning embeddings of large-scale knowledge graphs using a dataset of scientific publications](#)

## Bring Your Own Container with DGL

The following examples enable you to bring your own container (BYOC). Read the [BYOC guide](#) and familiarize yourself with that process before trying these. Configuration is required.

- [Molecular property prediction of toxicity using a GCN](#)
- [Recommender system for movies using a GCMC implementation](#)

# Extend a Prebuilt Container

If a prebuilt SageMaker container doesn't fulfill all of your requirements, you can extend the existing image to accommodate your needs. Even if there is direct support for your environment or framework, you may want to add additional functionality or configure your container environment differently. By extending a prebuilt image, you can leverage the included deep learning libraries and settings without having to create an image from scratch. You can extend the container to add libraries, modify settings, and install additional dependencies.

The following tutorial shows how to extend a prebuilt SageMaker image and publish it to Amazon ECR.

### Topics

- [Requirements to Extend a Prebuilt Container \(p. 2140\)](#)
- [Extend SageMaker Containers to Run a Python Script \(p. 2141\)](#)

## Requirements to Extend a Prebuilt Container

To extend a pre-built SageMaker image, you need to set the following environment variables within your Dockerfile. For more information on environment variables with SageMaker containers, see the [SageMaker Training Toolkit GitHub repo](#).

- **SAGEMAKER\_SUBMIT\_DIRECTORY:** The directory within the container in which the Python script for training is located.
- **SAGEMAKER\_PROGRAM:** The Python script that should be invoked and used as the entry point for training.

You can also install additional libraries by including the following in your Dockerfile:

```
RUN pip install <library>
```

The following tutorial shows how to use these environment variables.

## Extend SageMaker Containers to Run a Python Script

In this tutorial, you learn how to extend the SageMaker PyTorch container with a Python file that uses the CIFAR-10 dataset. By extending the SageMaker PyTorch container, you utilize the existing training solution made to work with SageMaker. This tutorial extends a training image, but the same steps can be taken to extend an inference image. For a full list of the available images, see [Available Deep Learning Containers Images](#).

To run your own training model using the SageMaker containers, build a Docker container through a SageMaker Notebook instance.

### Step 1: Create an SageMaker Notebook Instance

1. Open the [SageMaker console](#).
2. In the left navigation pane, choose **Notebook**, choose **Notebook instances**, and then choose **Create notebook instance**.
3. On the **Create notebook instance** page, provide the following information:
  - a. For **Notebook instance name**, enter **RunScriptNotebookInstance**.
  - b. For **Notebook Instance type**, choose **m1.t2.medium**.
  - c. In the **Permissions and encryption** section, do the following:
    - i. For **IAM role**, choose **Create a new role**.
    - ii. On the **Create an IAM role** page, choose **Specific S3 buckets**, specify an Amazon S3 bucket named **sagemaker-run-script**, and then choose **Create role**.SageMaker creates an IAM role named **AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmSS**, such as **AmazonSageMaker-ExecutionRole-20190429T110788**. Note that the execution role naming convention uses the date and time when the role was created, separated by a **T**.
  - d. For **Root Access**, choose **Enable**.
  - e. Choose **Create notebook instance**.
4. On the **Notebook instances** page, the **Status** is **Pending**. It can take a few minutes for Amazon SageMaker to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see [CreateNotebookInstance](#).
5. In the **Permissions and encryption** section, copy the **IAM role ARN number**, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The **IAM role ARN number** looks like the following: `'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'`
6. After the status of the notebook instance changes to **InService**, choose **Open JupyterLab**.

### Step 2: Create and Upload the Dockerfile and Python Training Scripts

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the **New Folder** icon, and then enter the folder name `docker_test_folder`.

2. Create a Dockerfile text file in the docker\_test\_folder directory.
  - a. Choose the **New Launcher** icon (+) in the upper-left corner.
  - b. In the right pane under the **Other** section, choose **Text File**.
  - c. Paste the following Dockerfile sample code into your text file.

```
# SageMaker PyTorch image
FROM 763104351884.dkr.ecr.us-east-1.amazonaws.com/pytorch-training:1.5.1-cpu-py36-
ubuntu16.04

ENV PATH="/opt/ml/code:${PATH}"

# this environment variable is used by the SageMaker PyTorch container to determine
# our user code directory.
ENV SAGEMAKER_SUBMIT_DIRECTORY /opt/ml/code

# /opt/ml and all subdirectories are utilized by SageMaker, use the /code
# subdirectory to store your user code.
COPY cifar10.py /opt/ml/code/cifar10.py

# Defines cifar10.py as script entrypoint
ENV SAGEMAKER_PROGRAM cifar10.py
```

The Dockerfile script performs the following tasks:

- FROM 763104351884.dkr.ecr.us-east-1.amazonaws.com/pytorch-training:1.5.1-cpu-py36-ubuntu16.04 – Downloads the SageMaker PyTorch base image. You can replace this with any SageMaker base image you want to bring to build containers.
  - ENV SAGEMAKER\_SUBMIT\_DIRECTORY /opt/ml/code – Sets /opt/ml/code as the training script directory.
  - COPY cifar10.py /opt/ml/code/cifar10.py – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.
  - ENV SAGEMAKER\_PROGRAM cifar10.py – Sets your cifar10.py training script as the entrypoint script.
- d. On the left directory navigation pane, the text file name might automatically be named `untitled.txt`. To rename the file, right-click the file, choose **Rename**, rename the file as `Dockerfile` without the `.txt` extension, and then press `Ctrl+s` or `Command+s` to save the file.
  3. Create or upload a training script `cifar10.py` in the `docker_test_folder`. You can use the following example script for this exercise.

```
import ast
import argparse
import logging

import os

import torch
import torch.distributed as dist
import torch.nn as nn
import torch.nn.parallel
import torch.optim
import torch.utils.data
import torch.utils.data.distributed
import torchvision
import torchvision.models
import torchvision.transforms as transforms
import torch.nn.functional as F
```

```

logger=logging.getLogger(__name__)
logger.setLevel(logging.DEBUG)

classes=('plane', 'car', 'bird', 'cat', 'deer', 'dog', 'frog', 'horse', 'ship',

parser.add_argument('--num-gpus', type=int, default=os.environ['SM_NUM_GPUS'])

_train(parser.parse_args())

```

## Step 3: Build the Container

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the **New Launch** icon and then choose **conda\_pytorch\_p36** in the **Notebook** section.
2. Run the following command in the first notebook cell to change to the `docker_test_folder` directory:

```
% cd ~/SageMaker/docker_test_folder
```

This returns your current directory as follows:

```
! pwd
```

```
output: /home/ec2-user/SageMaker/docker_test_folder
```

3. Log in to Docker to access the base container:

```
! aws ecr get-login-password --region us-east-1 | docker login --username AWS --
password-stdin 763104351884.dkr.ecr.us-east-1.amazonaws.com
```

4. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

```
! docker build -t pytorch-extended-container-test .
```

The Docker build command must be run from the Docker directory you created, in this case `docker_test_folder`.

**Note**

If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

```
unable to prepare context: unable to evaluate symlinks in Dockerfile path:
```

```
lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory
```

Remember that docker looks for a file specifically called Dockerfile without any extension within the current directory. If you named it something else, you can pass in the file name manually with the -f flag. For example, if you named your Dockerfile Dockerfile-text.txt, run the following command:

```
! docker build -t tf-custom-container-test -f Dockerfile-text.txt .
```

## Step 4: Test the Container

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose **New Launcher** and choose **Notebook** in **conda\_pytorch\_p36** framework. The rest of the code snippets must run from the Jupyter notebook instance.
2. Download the CIFAR-10 dataset.

```
import torch
import torchvision
import torchvision.transforms as transforms

def _get_transform():
    return transforms.Compose(
        [transforms.ToTensor(),
         transforms.Normalize((0.5, 0.5, 0.5), (0.5, 0.5, 0.5))])

def get_train_data_loader(data_dir='/tmp/pytorch/cifar-10-data'):
    transform=_get_transform()
    trainset=torchvision.datasets.CIFAR10(root=data_dir, train=True,
                                           download=True, transform=transform)
    return torch.utils.data.DataLoader(trainset, batch_size=4,
                                       shuffle=True, num_workers=2)

def get_test_data_loader(data_dir='/tmp/pytorch/cifar-10-data'):
    transform=_get_transform()
    testset=torchvision.datasets.CIFAR10(root=data_dir, train=False,
                                         download=True, transform=transform)
    return torch.utils.data.DataLoader(testset, batch_size=4,
                                       shuffle=False, num_workers=2)

trainloader=get_train_data_loader('/tmp/pytorch-example/cifar-10-data')
testloader=get_test_data_loader('/tmp/pytorch-example/cifar-10-data')
```

3. Set role to the role used to create your Jupyter notebook. This is used to configure your SageMaker Estimator.

```
from sagemaker import get_execution_role
role=get_execution_role()
```

4. Paste the following example script into the notebook code cell to configure a SageMaker Estimator using your extended container.

```
from sagemaker.estimator import Estimator
hyperparameters={'epochs': 1}
estimator=Estimator(
```

```

        image_uri='pytorch-extended-container-test',
        role=role,
        instance_count=1,
        instance_type='local',
        hyperparameters=hyperparameters
    )

estimator.fit('file:///tmp/pytorch-example/cifar-10-data')

```

- Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

## Step 5: Push the Container to Amazon Elastic Container Registry (Amazon ECR)

- After you successfully run the local mode test, you can push the Docker container to [Amazon ECR](#) and use it to run training jobs.

Run the following command lines in a notebook cell.

```

%%sh

# Specify an algorithm name
algorithm_name=pytorch-extended-container-test

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none
# defined)
region=$(aws configure get region)

fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn't exist in ECR, create it.

aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null
fi

# Build the docker image locally with the image name and then push it to ECR
# with the full name.

docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}

docker push ${fullname}

```

- After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```

import boto3

client=boto3.client('sts')
account=client.get_caller_identity()['Account']

my_session=boto3.session.Session()
region=my_session.region_name

```

```
algorithm_name="pytorch-extended-container-test"
ecr_image='{}.dkr.ecr.{}.amazonaws.com/{}:latest'.format(account, region,
algorithm_name)

ecr_image
# This should return something like
# 12-digits-of-your-account.dkr.ecr.us-east-2.amazonaws.com/tf-2.2-test:latest
```

3. Use the `ecr_image` retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker PyTorch estimator.

```
import sagemaker

from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator=Estimator(
    image_uri=ecr_image,
    role=get_execution_role(),
    base_job_name='pytorch-extended-container-test',
    instance_count=1,
    instance_type='ml.p2.xlarge'
)

# start training
estimator.fit()

# deploy the trained model
predictor=estimator.deploy(1, instance_type)
```

## Step 6: Clean up Resources

### To clean up resources when done with the Get Started example

1. Open the [SageMaker console](#), choose the notebook instance **RunScriptNotebookInstance**, choose **Actions**, and choose **Stop**. It can take a few minutes for the instance to stop.
2. After the instance **Status** changes to **Stopped**, choose **Actions**, choose **Delete**, and then choose **Delete** in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.
3. Open the [Amazon S3 console](#) and delete the bucket that you created for storing model artifacts and the training dataset.
4. Open the [IAM console](#) and delete the IAM role. If you created permission policies, you can delete them, too.

#### Note

The Docker container shuts down automatically after it has run. You don't need to delete it.

# Adapting Your Own Docker Container to Work with SageMaker

You can adapt an existing Docker image to work with SageMaker. You may need to use an existing, external Docker image with SageMaker when you have a container that satisfies feature or safety requirements that are not currently supported by a prebuilt SageMaker image. There are two toolkits that allow you to bring your own container and adapt it to work with SageMaker:

- [SageMaker Training Toolkit](#)
- [SageMaker Inference Toolkit](#)

The following topics show how to adapt your existing image using the SageMaker Training and Inference toolkits:

#### Topics

- [Individual Framework Libraries \(p. 2149\)](#)
- [Using the SageMaker Training and Inference Toolkits \(p. 2149\)](#)
- [Adapting Your Own Training Container \(p. 2151\)](#)
- [Adapting Your Own Inference Container \(p. 2156\)](#)

## Individual Framework Libraries

In addition to the SageMaker Training Toolkit and SageMaker Inference Toolkit, SageMaker also provides toolkits specialized for TensorFlow, MXNet, PyTorch, and Chainer. The following table provides links to the GitHub repositories that contain the source code for each framework and their respective serving toolkits. The instructions linked are for using the Python SDK to run training algorithms and host models on SageMaker. The functionality for these individual libraries is included in the SageMaker Training Toolkit and SageMaker Inference Toolkit.

Framework	Toolkit Source Code
TensorFlow	<a href="#">SageMaker TensorFlow Training</a> <a href="#">SageMaker TensorFlow Serving</a>
MXNet	<a href="#">SageMaker MXNet Training</a> <a href="#">SageMaker MXNet Inference</a>
PyTorch	<a href="#">SageMaker PyTorch Training</a> <a href="#">SageMaker PyTorch Inference</a>
Chainer	<a href="#">SageMaker Chainer SageMaker Containers</a>

## Using the SageMaker Training and Inference Toolkits

The [SageMaker Training](#) and [SageMaker Inference](#) toolkits implement the functionality that you need to adapt your containers to run scripts, train algorithms, and deploy models on SageMaker. When installed, the library defines the following for users:

- The locations for storing code and other resources.
- The entry point that contains the code to run when the container is started. Your Dockerfile must copy the code that needs to be run into the location expected by a container that is compatible with SageMaker.
- Other information that a container needs to manage deployments for training and inference.

## SageMaker Toolkits Containers Structure

When SageMaker trains a model, it creates the following file folder structure in the container's `/opt/ml` directory.

```
/opt/ml
### input
#   ### config
#   #   ### hyperparameters.json
#   #   ### resourceConfig.json
#   ### data
#       ### <channel_name>
#           ### <input data>
### model
#
### code
#
### output
#
### failure
```

When you run a model *training* job, the SageMaker container uses the `/opt/ml/input/` directory, which contains the JSON files that configure the hyperparameters for the algorithm and the network layout used for distributed training. The `/opt/ml/input/` directory also contains files that specify the channels through which SageMaker accesses the data, which is stored in Amazon Simple Storage Service (Amazon S3). The SageMaker containers library places the scripts that the container will run in the `/opt/ml/code/` directory. Your script should write the model generated by your algorithm to the `/opt/ml/model/` directory. For more information, see [Use Your Own Training Algorithms \(p. 2160\)](#).

When you *host* a trained model on SageMaker to make inferences, you deploy the model to an HTTP endpoint. The model makes real-time predictions in response to inference requests. The container must contain a serving stack to process these requests.

In a hosting or batch transform container, the model files are located in the same folder to which they were written during training.

```
/opt/ml/model
#
### <model files>
```

For more information, see [Use Your Own Inference Code \(p. 2166\)](#).

## Single Versus Multiple Containers

You can either provide separate Docker images for the training algorithm and inference code or you can use a single Docker image for both. When creating Docker images for use with SageMaker, consider the following:

- Providing two Docker images can increase storage requirements and cost because common libraries might be duplicated.
- In general, smaller containers start faster for both training and hosting. Models train faster and the hosting service can react to increases in traffic by automatically scaling more quickly.
- You might be able to write an inference container that is significantly smaller than the training container. This is especially common when you use GPUs for training, but your inference code is optimized for CPUs.
- SageMaker requires that Docker containers run without privileged access.

- Both Docker containers that you build and those provided by SageMaker can send messages to the `Stdout` and `Stderr` files. SageMaker sends these messages to Amazon CloudWatch logs in your Amazon account.

For more information about how to create SageMaker containers and how scripts are executed inside them, see the [SageMaker Training Toolkit](#) and [SageMaker Inference Toolkit](#) repositories on GitHub. They also provide lists of important environmental variables and the environmental variables provided by SageMaker containers.

## Adapting Your Own Training Container

To run your own training model, build a Docker container using the [Amazon SageMaker Training Toolkit](#) through an Amazon SageMaker notebook instance.

### Step 1: Create a SageMaker notebook instance

- Open the Amazon SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
- In the left navigation pane, choose **Notebook**, choose **Notebook instances**, and then choose **Create notebook instance**.
- On the **Create notebook instance** page, provide the following information:
  - For **Notebook instance name**, enter `RunScriptNotebookInstance`.
  - For **Notebook Instance type**, choose `m1.t2.medium`.
  - In the **Permissions and encryption** section, do the following:
    - For **IAM role**, choose **Create a new role**.
    - On the **Create an IAM role** page, choose **Specific S3 buckets**, specify an Amazon S3 bucket named `sagemaker-run-script`, and then choose **Create role**.

SageMaker creates an IAM role named `AmazonSageMaker-ExecutionRole-YYYYMMDDTHHmmSS`. For example, `AmazonSageMaker-ExecutionRole-20190429T110788`. Note that the execution role naming convention uses the date and time at which the role was created, separated by a `T`.
  - For **Root Access**, choose **Enable**.
  - Choose **Create notebook instance**.
- On the **Notebook instances** page, the **Status** is **Pending**. It can take a few minutes for Amazon SageMaker to launch a machine learning compute instance—in this case, it launches a notebook instance—and attach an ML storage volume to it. The notebook instance has a preconfigured Jupyter notebook server and a set of Anaconda libraries. For more information, see [CreateNotebookInstance](#).
- In the **Permissions and encryption** section, copy the **IAM role ARN number**, and paste it into a notepad file to save it temporarily. You use this IAM role ARN number later to configure a local training estimator in the notebook instance. The **IAM role ARN number** looks like the following: '`arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788`'
- After the status of the notebook instance changes to **InService**, choose **Open JupyterLab**.

## Step 2: Create and upload the Dockerfile and Python training scripts

1. After JupyterLab opens, create a new folder in the home directory of your JupyterLab. In the upper-left corner, choose the **New Folder** icon, and then enter the folder name `docker_test_folder`.
2. Create a Dockerfile text file in the `docker_test_folder` directory.
  - a. Choose the **New Launcher** icon (+) in the upper-left corner.
  - b. In the right pane under the **Other** section, choose **Text File**.
  - c. Paste the following Dockerfile sample code into your text file.

```
FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter

# Install sagemaker-training toolkit that contains the common functionality
# necessary to create a container compatible with SageMaker and the Python SDK.
RUN pip3 install sagemaker-training

# Copies the training code inside the container
COPY train.py /opt/ml/code/train.py

# Defines train.py as script entrypoint
ENV SAGEMAKER_PROGRAM train.py
```

The Dockerfile script performs the following tasks:

- `FROM tensorflow/tensorflow:2.2.0rc2-gpu-py3-jupyter` – Downloads the TensorFlow Docker base image. You can replace this with any Docker base image you want to bring to build containers, as well as with Amazon pre-built container base images.
  - `RUN pip install sagemaker-training` – Installs [SageMaker Training Toolkit](#) that contains the common functionality necessary to create a container compatible with SageMaker.
  - `COPY train.py /opt/ml/code/train.py` – Copies the script to the location inside the container that is expected by SageMaker. The script must be located in this folder.
  - `ENV SAGEMAKER_PROGRAM train.py` – Takes your training script `train.py` as the entrypoint script copied in the `/opt/ml/code` folder of the container. This is the only environmental variable that you must specify when you build your own container.
- d. On the left directory navigation pane, the text file name might automatically be named `untitled.txt`. To rename the file, right-click the file, choose **Rename**, rename the file as `Dockerfile` without the `.txt` extension, and then press `Ctrl+s` or `Command+s` to save the file.
  3. Create or upload a training script `train.py` in the `docker_test_folder`. You can use the following example script for this exercise.

```
import tensorflow as tf

mnist = tf.keras.datasets.mnist

(x_train, y_train), (x_test, y_test) = mnist.load_data()
x_train, x_test = x_train / 255.0, x_test / 255.0

model = tf.keras.models.Sequential([
    tf.keras.layers.Flatten(input_shape=(28, 28)),
    tf.keras.layers.Dense(128, activation='relu'),
    tf.keras.layers.Dropout(0.2),
    tf.keras.layers.Dense(10, activation='softmax')
])
```

```
model.compile(optimizer='adam',
  loss='sparse_categorical_crossentropy',
  metrics=['accuracy'])

model.fit(x_train, y_train, epochs=1)

model.evaluate(x_test, y_test)
```

## Step 3: Build the container

1. In the JupyterLab home directory, open a Jupyter notebook. To open a new notebook, choose the **New Launch** icon and then choose **conda\_tensorflow2\_p36** in the **Notebook** section.
2. Run the following command in the first notebook cell to change to the `docker_test_folder` directory:

```
% cd ~/SageMaker/docker_test_folder
```

This returns your current directory as follows:

```
! pwd
```

```
output: /home/ec2-user/SageMaker/docker_test_folder
```

3. To build the Docker container, run the following Docker build command, including the space followed by a period at the end:

```
! docker build -t tf-custom-container-test .
```

The Docker build command must be run from the Docker directory you created, in this case `docker_test_folder`.

**Note**

If you get the following error message that Docker cannot find the Dockerfile, make sure the Dockerfile has the correct name and has been saved to the directory.

```
unable to prepare context: unable to evaluate symlinks in Dockerfile path:
lstat /home/ec2-user/SageMaker/docker/Dockerfile: no such file or directory
```

Remember that `docker` looks for a file specifically called `Dockerfile` without any extension within the current directory. If you named it something else, you can pass in the file name manually with the `-f` flag. For example, if you named your Dockerfile as `Dockerfile-text.txt`, run the following command:

```
! docker build -t tf-custom-container-test -f Dockerfile-text.txt .
```

## Step 4: Test the container

1. To test the container locally in the notebook instance, open a Jupyter notebook. Choose **New Launcher** and choose **Notebook** in **conda\_tensorflow\_p36** framework.
2. Paste the following example script into the notebook code cell to configure a SageMaker Estimator.

### SageMaker Python SDK v1

```
from sagemaker.estimator import Estimator

estimator = Estimator(image_name='tf-custom-container-test',
                      role='arn:aws:iam::111122223333:role/role-name',
                      instance_count=1,
                      instance_type='local')

estimator.fit()
```

### SageMaker Python SDK v2

```
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri='tf-custom-container-test',
                      role='arn:aws:iam::111122223333:role/role-name',
                      instance_count=1,
                      instance_type='local')

estimator.fit()
```

3. Replace the 'Put\_Your\_ARN\_Here' value with **the IAM role ARN number** you copied to a notepad file when you configured the notebook instance. The ARN should look like the following: 'arn:aws:iam::111122223333:role/service-role/AmazonSageMaker-ExecutionRole-20190429T110788'.
4. Run the code cell. This test outputs the training environment configuration, the values used for the environmental variables, the source of the data, and the loss and accuracy obtained during training.

## Step 5: Push the container to Amazon Elastic Container Registry (Amazon ECR)

1. After you successfully run the local mode test, you can push the Docker container to [Amazon ECR](#) and use it to run training jobs.

Run the following command lines in a notebook cell.

```
%%sh

# Specify an algorithm name
algorithm_name=tf-custom-container-test

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none
# defined)
region=$(aws configure get region)
region=${region:-us-west-2}

fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn't exist in ECR, create it.

aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1
if [ $? -ne 0 ]
then
aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null
fi
```

```
# Get the login command from ECR and execute it directly
$(aws ecr get-login --region ${region} --no-include-email)

# Build the docker image locally with the image name and then push it to ECR
# with the full name.

docker build -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}

docker push ${fullname}
```

### Note

This bash shell script may raise a permission issue similar to the following error message:

```
"denied: User: [ARN] is not authorized to perform: ecr:InitiateLayerUpload on
resource:
arn:aws:ecr:us-east-1:[id]:repository/tf-custom-container-test"
```

If this error occurs, you need to attach the **AmazonEC2ContainerRegistryFullAccess** policy to your IAM role. Go to the [IAM console](#), choose **Roles** from the left navigation pane, look up the IAM role you used for the Notebook instance. Under the **Permission** tab, choose the **Attach policies** button, and search the **AmazonEC2ContainerRegistryFullAccess** policy. Mark the check box of the policy, and choose **Attach policy** to finish.

2. After you push the container, you can call the Amazon ECR image from anywhere in the SageMaker environment. Run the following code example in the next notebook cell.

If you want to use this training container with SageMaker Studio to use its visualization features, you can also run the following code in a Studio notebook cell to call the Amazon ECR image of your training container.

```
import boto3

account_id = boto3.client('sts').get_caller_identity().get('Account')
ecr_repository = 'sagemaker-byoc-test'
tag = ':latest'

region = boto3.session.Session().region_name

uri_suffix = 'amazonaws.com'
if region in ['cn-north-1', 'cn-northwest-1']:
    uri_suffix = 'amazonaws.com.cn'

byoc_image_uri = '{}.dkr.ecr.{}.{}'.format(account_id, region, uri_suffix,
                                           ecr_repository + tag)

byoc_image_uri
# This should return something like
# 111122223333.dkr.ecr.us-east-2.amazonaws.com/sagemaker-byoc-test:latest
```

3. Use the `ecr_image` retrieved from the previous step to configure a SageMaker estimator object. The following code sample configures a SageMaker estimator with the `byoc_image_uri` and initiates a training job on an Amazon EC2 instance.

### SageMaker Python SDK v1

```
import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator
```

```

estimator = Estimator(image_name=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)

```

### SageMaker Python SDK v2

```

import sagemaker
from sagemaker import get_execution_role
from sagemaker.estimator import Estimator

estimator = Estimator(image_uri=byoc_image_uri,
                      role=get_execution_role(),
                      base_job_name='tf-custom-container-test-job',
                      instance_count=1,
                      instance_type='ml.p2.xlarge')

# start training
estimator.fit()

# deploy the trained model
predictor = estimator.deploy(1, instance_type)

```

For a full example that shows how to test a custom container locally and push it to an Amazon ECR image, see the [Building Your Own TensorFlow Container](#) example notebook.

## Step 6: Clean up resources

### To clean up resources when done with the get started example

1. Open the [SageMaker console](#), choose the notebook instance **RunScriptNotebookInstance**, choose **Actions**, and choose **Stop**. It can take a few minutes for the instance to stop.
2. After the instance **Status** changes to **Stopped**, choose **Actions**, choose **Delete**, and then choose **Delete** in the dialog box. It can take a few minutes for the instance to be deleted. The notebook instance disappears from the table when it has been deleted.
3. Open the [Amazon S3 console](#) and delete the bucket that you created for storing model artifacts and the training dataset.
4. Open the [IAM console](#) and delete the IAM role. If you created permission policies, you can delete them, too.

#### Note

The Docker container shuts down automatically after it has run. You don't need to delete it.

## Adapting Your Own Inference Container

If none of the Amazon SageMaker prebuilt inference containers suffice for your situation, and you want to use your own Docker container, use the [SageMaker Inference Toolkit](#) to adapt your container to work with SageMaker hosting. To adapt your container to work with SageMaker hosting, create the inference code in one or more Python script files and a Dockerfile that imports the inference toolkit.

The inference code includes an inference handler, a handler service, and an endpoint. In this example, they are stored as three separate Python files. All three of these Python files must be in the same directory as your Dockerfile.

For an example Jupyter notebook that shows a complete example of extending a container by using the SageMaker inference toolkit, see [Amazon SageMaker Multi-Model Endpoints using your own algorithm container](#).

## Step 1: Create an Inference Handler

The SageMaker inference toolkit is built on the multi-model server (MMS). MMS expects a Python script that implements functions to load the model, pre-process input data, get predictions from the model, and process the output data in a model handler.

### The `model_fn` Function

The `model_fn` function is responsible for loading your model. It takes a `model_dir` argument that specifies where the model is stored. How you load your model depends on the framework you are using. There is no default implementation for the `model_fn` function. You must implement it yourself. The following simple example shows an implementation of a `model_fn` function that loads a PyTorch model:

```
def model_fn(self, model_dir):
    import torch

    logger.info('model_fn')
    device = "cuda" if torch.cuda.is_available() else "cpu"
    with open(os.path.join(model_dir, 'model.pth'), 'rb') as f:
        model = torch.jit.load(f)
    return model.to(device)
```

### The `input_fn` Function

The `input_fn` function is responsible for deserializing your input data so that it can be passed to your model. It takes input data and content type as parameters, and returns deserialized data. The SageMaker inference toolkit provides a default implementation that deserializes the following content types:

- JSON
- CSV
- Numpy array
- NPZ

If your model requires a different content type, or you want to preprocess your input data before sending it to the model, you must implement the `input_fn` function. The following example shows a simple implementation of the `input_fn` function.

```
from sagemaker_inference import content_types, decoder
def input_fn(self, input_data, content_type):
    """A default input_fn that can handle JSON, CSV and NPZ formats.

    Args:
        input_data: the request payload serialized in the content_type format
        content_type: the request content_type

    Returns: input_data deserialized into torch.FloatTensor or torch.cuda.FloatTensor
    depending if cuda is available.
    """
    return decoder.decode(input_data, content_type)
```

## The predict\_fn Function

The `predict_fn` function is responsible for getting predictions from the model. It takes the model and the data returned from `input_fn` as parameters, and returns the prediction. There is no default implementation for the `predict_fn`. You must implement it yourself. The following is a simple implementation of the `predict_fn` function for a PyTorch model.

```
def predict_fn(self, data, model):
    """A default predict_fn for PyTorch. Calls a model on data deserialized in
    input_fn.
    Runs prediction on GPU if cuda is available.

    Args:
        data: input data (torch.Tensor) for prediction deserialized by input_fn
        model: PyTorch model loaded in memory by model_fn

    Returns: a prediction
    """
    return model(input_data)
```

## The output\_fn Function

The `output_fn` function is responsible for serializing the data that the `predict_fn` function returns as a prediction. The SageMaker inference toolkit implements a default `output_fn` function that serializes Numpy arrays, JSON, and CSV. If your model outputs any other content type, or you want to perform other post-processing of your data before sending it to the user, you must implement your own `output_fn` function. The following shows a simple `output_fn` function for a PyTorch model.

```
from sagemaker_inference import encoder
def output_fn(self, prediction, accept):
    """A default output_fn for PyTorch. Serializes predictions from predict_fn to JSON,
    CSV or NPY format.

    Args:
        prediction: a prediction result from predict_fn
        accept: type which the output data needs to be serialized

    Returns: output data serialized
    """
    return encoder.encode(prediction, accept)
```

## Step 2: Implement a Handler Service

The handler service is executed by the model server. The handler service implements `initialize` and `handle` methods. The `initialize` method is invoked when the model server starts, and the `handle` method is invoked for all incoming inference requests to the model server. For more information, see [Custom Service](#) in the Multi-model server documentation. The following is an example of a handler service for a PyTorch model server.

```
from sagemaker_inference.default_handler_service import DefaultHandlerService
from sagemaker_inference.transformer import Transformer
from sagemaker_pytorch_serving_container.default_inference_handler import
    DefaultPytorchInferenceHandler

class HandlerService(DefaultHandlerService):
    """Handler service that is executed by the model server.
    Determines specific default inference handlers to use based on model being used.
    This class extends ``DefaultHandlerService``, which define the following:
```

```

        - The ``handle`` method is invoked for all incoming inference requests to the model
server.
        - The ``initialize`` method is invoked at model server start up.
Based on: https://github.com/awslabs/mxnet-model-server/blob/master/docs/
custom_service.md
"""
def __init__(self):
    transformer =
Transformer(default_inference_handler=DefaultPytorchInferenceHandler())
super(HandlerService, self).__init__(transformer=transformer)

```

## Step 3: Implement an Entrypoint

The entrypoint starts the model server by invoking the handler service. You specify the location of the entrypoint in your Dockerfile. The following is an example of an entrypoint.

```

from sagemaker_inference import model_server
model_server.start_model_server(handler_service=HANDLER_SERVICE)

```

## Step 4: Write a Dockerfile

In your Dockerfile, copy the model handler from step 2 and specify the Python file from the previous step as the entrypoint in your Dockerfile. The following is an example of the lines you can add to your Dockerfile to copy the model handler and specify the entrypoint. For a full example of a Dockerfile for an inference container, see [Dockerfile](#).

```

# Copy the default custom service file to handle incoming data and inference requests
COPY model_handler.py /home/model-server/model_handler.py

# Define an entrypoint script for the docker image
ENTRYPOINT ["python", "/usr/local/bin/entrypoint.py"]

```

## Step 5: Build and Register Your Container

Now you can build your container and register it in Amazon Elastic Container Registry (Amazon ECR). The following shell script from the sample notebook builds the container and uploads it to an Amazon ECR repository in your Amazon account.

### Note

SageMaker hosting supports using inference containers that are stored in repositories other than Amazon ECR. For information, see [Use a Private Docker Registry for Real-Time Inference Containers \(p. 2169\)](#).

The following shell script shows how to build and register a container.

```

%%sh

# The name of our algorithm
algorithm_name=demo-sagemaker-multimodel

cd container

account=$(aws sts get-caller-identity --query Account --output text)

# Get the region defined in the current configuration (default to us-west-2 if none
# defined)
region=$(aws configure get region)
region=${region:-us-west-2}

```

```
fullname="${account}.dkr.ecr.${region}.amazonaws.com/${algorithm_name}:latest"

# If the repository doesn't exist in ECR, create it.
aws ecr describe-repositories --repository-names "${algorithm_name}" > /dev/null 2>&1

if [ $? -ne 0 ]
then
    aws ecr create-repository --repository-name "${algorithm_name}" > /dev/null

# Get the login command from ECR and execute it directly
$(aws ecr get-login --region ${region} --no-include-email)

# Build the docker image locally with the image name and then push it to ECR
# with the full name.

docker build -q -t ${algorithm_name} .
docker tag ${algorithm_name} ${fullname}

docker push ${fullname}
```

You can now use this container to deploy endpoints in SageMaker. For an example of how to deploy an endpoint in SageMaker, see [Deploy the Model to SageMaker Hosting Services \(p. 63\)](#).

## Create a container with your own algorithms and models

If none of the existing SageMaker containers meet your needs and you don't have an existing container of your own, you may need to create a new Docker container. The following sections show how to create Docker containers with your training and inference algorithms for use with SageMaker.

### Topics

- [Use Your Own Training Algorithms \(p. 2160\)](#)
- [Use Your Own Inference Code \(p. 2166\)](#)

## Use Your Own Training Algorithms

This section explains how Amazon SageMaker interacts with a Docker container that runs your custom training algorithm. Use this information to write training code and create a Docker image for your training algorithms.

### Topics

- [How Amazon SageMaker Runs Your Training Image \(p. 2160\)](#)
- [How Amazon SageMaker Provides Training Information \(p. 2161\)](#)
- [Run Training with EFA \(p. 2164\)](#)
- [How Amazon SageMaker Signals Algorithm Success and Failure \(p. 2166\)](#)
- [How Amazon SageMaker Processes Training Output \(p. 2166\)](#)

## How Amazon SageMaker Runs Your Training Image

To configure a Docker container to run as an executable, use an `ENTRYPOINT` instruction in a Dockerfile. Note the following:

- For model training, Amazon SageMaker runs the container as follows:

```
docker run image train
```

SageMaker overrides any default `CMD` statement in a container by specifying the `train` argument after the image name. The `train` argument also overrides arguments that you provide using `CMD` in the Dockerfile.

- In your dockerfile, use the `exec` form of the `ENTRYPOINT` instruction:

```
ENTRYPOINT [ "executable", "param1", "param2", ... ]
```

For example:

```
ENTRYPOINT [ "python", "k-means-algorithm.py" ]
```

The `exec` form of the `ENTRYPOINT` instruction starts the executable directly, not as a child of `/bin/sh`. This enables it to receive signals like `SIGTERM` and `SIGKILL` from SageMaker APIs. Note the following:

- The [CreateTrainingJob](#) API has a stopping condition that directs SageMaker to stop model training after a specific time.
- The [StopTrainingJob](#) API issues the equivalent of the `docker stop`, with a 2-minute timeout command to gracefully stop the specified container:

```
docker stop -t120
```

The command attempts to stop the running container by sending a `SIGTERM` signal. After the 2-minute timeout, `SIGKILL` is sent and the containers are forcibly stopped. If the container handles the `SIGTERM` gracefully and exits within 120 seconds from receiving it, no `SIGKILL` is sent.

#### Note

If you want access to the intermediate model artifacts after SageMaker stops the training, add code to handle saving artifacts in your `SIGTERM` handler.

- If you plan to use GPU devices for model training, make sure that your containers are `nvidia-docker` compatible. Only the CUDA toolkit should be included on containers; don't bundle NVIDIA drivers with the image. For more information about `nvidia-docker`, see [NVIDIA/nvidia-docker](#).
- You can't use the `tini` initializer as your entry point in SageMaker containers because it gets confused by the `train` and `serve` arguments.
- `/opt/ml` and all sub-directories are reserved by SageMaker training. When building your algorithm's Docker image, please ensure you don't place any data required by your algorithm under them as the data may no longer be visible during training.

## How Amazon SageMaker Provides Training Information

This section explains how SageMaker makes training information, such as training data, hyperparameters, and other configuration information, available to your Docker container.

When you send a [CreateTrainingJob](#) request to SageMaker to start model training, you specify the Amazon Elastic Container Registry path of the Docker image that contains the training algorithm. You also specify the Amazon Simple Storage Service (Amazon S3) location where training data is stored and algorithm-specific parameters. SageMaker makes this information available to the Docker container so

that your training algorithm can use it. This section explains how we make this information available to your Docker container. For information about creating a training job, see [CreateTrainingJob](#). For more information on the way that SageMaker containers organize information, see [Using the SageMaker Training and Inference Toolkits \(p. 2149\)](#).

### Topics

- [Hyperparameters \(p. 2162\)](#)
- [Environment Variables \(p. 2162\)](#)
- [Input Data Configuration \(p. 2162\)](#)
- [Training Data \(p. 2163\)](#)
- [Distributed Training Configuration \(p. 2163\)](#)

## Hyperparameters

SageMaker makes the hyperparameters in a `CreateTrainingJob` request available in the Docker container in the `/opt/ml/input/config/hyperparameters.json` file.

## Environment Variables

The following environment variables are set in the container:

- `TRAINING_JOB_NAME` – Specified in the `TrainingJobName` parameter of the `CreateTrainingJob` request.
- `TRAINING_JOB_ARN` – The Amazon Resource Name (ARN) of the training job returned as the `TrainingJobArn` in the `CreateTrainingJob` response.
- All environment variables specified in the [Environment](#) parameter in the `CreateTrainingJob` request.

## Input Data Configuration

You specify data channel information in the `InputDataConfig` parameter in a `CreateTrainingJob` request. SageMaker makes this information available in the `/opt/ml/input/config/inputdataconfig.json` file in the Docker container.

For example, suppose that you specify three data channels (`train`, `evaluation`, and `validation`) in your request. SageMaker provides the following JSON:

```
{  
  "train" : {"ContentType": "trainingContentType",  
            "TrainingInputMode": "File",  
            "S3DistributionType": "FullyReplicated",  
            "RecordWrapperType": "None"},  
  "evaluation" : {"ContentType": "evalContentType",  
                 "TrainingInputMode": "File",  
                 "S3DistributionType": "FullyReplicated",  
                 "RecordWrapperType": "None"},  
  "validation" : {"TrainingInputMode": "File",  
                 "S3DistributionType": "FullyReplicated",  
                 "RecordWrapperType": "None"}  
}
```

### Note

SageMaker provides only relevant information about each data channel (for example, the channel name and the content type) to the container, as shown. `S3DistributionType` will be set as `FullyReplicated` if specify EFS or FSxLustre as input data sources.

## Training Data

The `TrainingInputMode` parameter in a `CreateTrainingJob` request specifies how to make data available for model training: in `FILE` mode or `PIPE` mode. Depending on the specified input mode, SageMaker does the following:

- **FILE mode**—SageMaker makes the data for the channel available in the `/opt/ml/input/data/channel_name` directory in the Docker container. For example, if you have three channels named `training`, `validation`, and `testing`, SageMaker makes three directories in the Docker container:
  - `/opt/ml/input/data/training`
  - `/opt/ml/input/data/validation`
  - `/opt/ml/input/data/testing`
- **Note**  
Channels that use file system data sources such as Amazon Elastic File System (Amazon EFS) and Amazon FSx must use FILE mode. Also to utilize an Amazon FSx file server, you must specify a path that begins with `/fsx`. If a file system is specified, the directory path provided in the channel is mounted at `/opt/ml/input/data/channel_name`.
- **PIPE mode**—SageMaker makes data for the channel available from the named pipe: `/opt/ml/input/data/channel_name_epoch_number`. For example, if you have three channels named `training`, `validation`, and `testing`, you will need to read from the following pipes:
  - `/opt/ml/input/data/training_0`, `/opt/ml/input/data/training_1`, ...
  - `/opt/ml/input/data/validation_0`, `/opt/ml/input/data/validation_1`, ...
  - `/opt/ml/input/data/testing_0`, `/opt/ml/input/data/testing_1`, ...

Read the pipes sequentially. For example, if you have a channel called `training`, read the pipes in this sequence:

1. Open `/opt/ml/input/data/training_0` in read mode and read it to end-of-file (EOF) or, if you are done with the first epoch, close the pipe file early.
2. After closing the first pipe file, look for `/opt/ml/input/data/training_1` and read it until you have completed the second epoch, and so on.

If the file for a given epoch doesn't exist yet, your code may need to retry until the pipe is created. There is no sequencing restriction across channel types. That is, you can read multiple epochs for the `training` channel, for example, and only start reading the `validation` channel when you are ready. Or, you can read them simultaneously if your algorithm requires that.

## Distributed Training Configuration

If you're performing distributed training with multiple containers, SageMaker makes information about all containers available in the `/opt/ml/input/config/resourceconfig.json` file.

To enable inter-container communication, this JSON file contains information for all containers. SageMaker makes this file available for both FILE and PIPE mode algorithms. The file provides the following information:

- `current_host`—The name of the current container on the container network. For example, `algo-1`. Host values can change at any time. Don't write code with specific values for this variable.
- `hosts`—The list of names of all containers on the container network, sorted lexicographically. For example, `["algo-1", "algo-2", "algo-3"]` for a three-node cluster. Containers can use these names to address other containers on the container network. Host values can change at any time. Don't write code with specific values for these variables.

- `network_interface_name`—The name of the network interface that is exposed to your container. For example, containers running the Message Passing Interface (MPI) can use this information to set the network interface name.
- Do not use the information in `/etc/hostname` or `/etc/hosts` because it might be inaccurate.
- Hostname information may not be immediately available to the algorithm container. We recommend adding a retry policy on hostname resolution operations as nodes become available in the cluster.

The following is an example file on node 1 in a three-node cluster:

```
{  
"current_host": "algo-1",  
"hosts": ["algo-1", "algo-2", "algo-3"],  
"network_interface_name": "eth1"  
}
```

## Run Training with EFA

SageMaker provides integration with [EFA](#) devices to accelerate High Performance Computing (HPC) and machine learning applications. This integration allows you to leverage an EFA device when running your distributed training jobs. You can add EFA integration to an existing Docker container that you bring to SageMaker. The following information outlines how to configure your own container to use an EFA device for your distributed training jobs.

### Prerequisites

Your container must satisfy the [SageMaker Training container specification](#).

### Install EFA and required packages

Your container must download and install the [EFA software](#). This allows your container to recognize the EFA device, and provides compatible versions of Libfabric and Open MPI.

Any tools like MPI and NCCL must be installed and managed inside the container to be used as part of your EFA-enabled training job. The following example shows how to modify the Dockerfile of your EFA-enabled container to install EFA, MPI, OFI, NCCL, and NCCL-TEST.

#### Note

When using PyTorch with EFA on your container, the NCCL version of your container should match the NCCL version of your PyTorch installation. To verify the PyTorch NCCL version, use the following command:

```
torch.cuda.nccl.version()
```

```
ARG OPEN_MPI_PATH=/opt/amazon/openmpi/  
ENV NCCL_VERSION=2.7.8  
ENV EFA_VERSION=1.11.2  
ENV BRANCH_OFI=1.1.1  
  
#####  
## EFA and MPI SETUP  
RUN cd $HOME \  
    && curl -O https://s3-us-west-2.amazonaws.com/aws-efa-installer/aws-efa-installer-  
${EFA_VERSION}.tar.gz \  
    && tar -xf aws-efa-installer-${EFA_VERSION}.tar.gz \  
    && cd aws-efa-installer \  
    && ./efa_installer.sh -y --skip-kmod -g \  
    && rm -rf aws-efa-installer
```

```

ENV PATH="$OPEN_MPI_PATH/bin:$PATH"
ENV LD_LIBRARY_PATH="$OPEN_MPI_PATH/lib/:$LD_LIBRARY_PATH"

#####
## NCCL, OFI, NCCL-TEST SETUP
RUN cd $HOME \
    && git clone https://github.com/NVIDIA/nccl.git -b v${NCCL_VERSION}-1 \
    && cd nccl \
    && make -j64 src.build BUILDDIR=/usr/local

RUN apt-get update && apt-get install -y autoconf
RUN cd $HOME \
    && git clone https://github.com/aws/aws-ofi-nccl.git -b v${BRANCH_OFI} \
    && cd aws-ofi-nccl \
    && ./autogen.sh \
    && ./configure --with-libfabric=/opt/amazon/efa \
        --with-mpi=/opt/amazon/openmpi \
        --with-cuda=/usr/local/cuda \
        --with-nccl=/usr/local --prefix=/usr/local \
    && make && make install

RUN cd $HOME \
    && git clone https://github.com/NVIDIA/nccl-tests \
    && cd nccl-tests \
    && make MPI=1 MPI_HOME=/opt/amazon/openmpi CUDA_HOME=/usr/local/cuda NCCL_HOME=/usr/local

```

## Considerations when creating your container

The EFA device is mounted to the container as `/dev/infiniband/uverbs0` under the list of device's accessible to the container. On P4d instances, the container has access to 4 EFA devices. The EFA devices can be found in the list of devices accessible to the container as:

- `/dev/infiniband/uverbs0`
- `/dev/infiniband/uverbs1`
- `/dev/infiniband/uverbs2`
- `/dev/infiniband/uverbs3`

To get information about hostname, peer hostnames, and network interface (for MPI) from the `resourceconfig.json` file provided to each container instances, see [Distributed Training Configuration](#). Your container handles regular TCP traffic among peers through the default Elastic Network Interfaces (ENI), while handling OFI (kernel bypass) traffic through the EFA device.

## Verify that your EFA device is recognized

To verify that the EFA device is recognized, run the following command from within your container.

```
/opt/amazon/efa/bin/fi_info -p efa
```

Your output should look similar to the following.

```

provider: efa
  fabric: EFA-fe80::e5:56ff:fe34:56a8
  domain: efa_0-rdm
  version: 2.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA
provider: efa

```

```
fabric: EFA-fe80::e5:56ff:fe34:56a8
domain: efa_0-dgrm
version: 2.0
type: FI_EP_DGRAM
protocol: FI_PROTO_EFA
provider: efa;ofi_rxrd
fabric: EFA-fe80::e5:56ff:fe34:56a8
domain: efa_0-dgrm
version: 1.0
type: FI_EP_RDM
protocol: FI_PROTO_RXD
```

## Running a training job with EFA

Once you've created an EFA-enabled container, you can run a training job with EFA using a SageMaker Estimator the same way as you would with any other docker image. For more information on registering your container and using it for training, see [Adapting Your Own Training Container](#).

## How Amazon SageMaker Signals Algorithm Success and Failure

A training algorithm indicates whether it succeeded or failed using the exit code of its process.

A successful training execution should exit with an exit code of 0 and an unsuccessful training execution should exit with a non-zero exit code. These will be converted to `Completed` and `Failed` in the `TrainingJobStatus` returned by `DescribeTrainingJob`. This exit code convention is standard and is easily implemented in all languages. For example, in Python, you can use `sys.exit(1)` to signal a failure exit, and simply running to the end of the main routine will cause Python to exit with code 0.

In the case of failure, the algorithm can write a description of the failure to the failure file. See next section for details.

## How Amazon SageMaker Processes Training Output

As your algorithm runs in a container, it generates output including the status of the training job and model and output artifacts. Your algorithm should write this information to the following files, which are located in the container's `/output` directory. Amazon SageMaker processes the information contained in this directory as follows:

- `/opt/ml/output/failure`—If training fails, after all algorithm output (for example, logging) completes, your algorithm should write the failure description to this file. In a `DescribeTrainingJob` response, SageMaker returns the first 1024 characters from this file as `FailureReason`.
- `/opt/ml/model`—Your algorithm should write all final model artifacts to this directory. SageMaker copies this data as a single object in compressed tar format to the S3 location that you specified in the `CreateTrainingJob` request. If multiple containers in a single training job write to this directory they should ensure no file/directory names clash. SageMaker aggregates the result in a tar file and uploads to s3.

## Use Your Own Inference Code

You can use Amazon SageMaker to interact with Docker containers and run your own inference code in one of two ways:

- To use your own inference code with a persistent endpoint to get one prediction at a time, use SageMaker hosting services.

- To use your own inference code to get predictions for an entire dataset, use SageMaker batch transform.

#### Topics

- [Use Your Own Inference Code with Hosting Services \(p. 2167\)](#)
- [Use Your Own Inference Code with Batch Transform \(p. 2172\)](#)

## Use Your Own Inference Code with Hosting Services

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for hosting services. Use this information to write inference code and create a Docker image.

#### Topics

- [How SageMaker Runs Your Inference Image \(p. 2167\)](#)
- [How SageMaker Loads Your Model Artifacts \(p. 2168\)](#)
- [How Containers Serve Requests \(p. 2168\)](#)
- [How Your Container Should Respond to Inference Requests \(p. 2168\)](#)
- [How Your Container Should Respond to Health Check \(Ping\) Requests \(p. 2169\)](#)
- [Use a Private Docker Registry for Real-Time Inference Containers \(p. 2169\)](#)

## How SageMaker Runs Your Inference Image

To configure a container to run as an executable, use an `ENTRYPOINT` instruction in a Dockerfile. Note the following:

- For model inference, SageMaker runs the container as:

```
docker run image serve
```

SageMaker overrides default `CMD` statements in a container by specifying the `serve` argument after the `image` name. The `serve` argument overrides arguments that you provide with the `CMD` command in the Dockerfile.

- We recommend that you use the `exec` form of the `ENTRYPOINT` instruction:

```
ENTRYPOINT [ "executable", "param1", "param2" ]
```

For example:

```
ENTRYPOINT [ "python", "k_means_inference.py" ]
```

The `exec` form of the `ENTRYPOINT` instruction starts the executable directly, not as a child of `/bin/sh`. This enables it to receive signals like `SIGTERM` and `SIGKILL` from the SageMaker API operations, which is a requirement.

For example, when you use the [CreateEndpoint](#) API to create an endpoint, SageMaker provisions the number of ML compute instances required by the endpoint configuration, which you specify in the request. SageMaker runs the Docker container on those instances.

If you reduce the number of instances backing the endpoint (by calling the [UpdateEndpointWeightsAndCapacities](#) API), SageMaker runs a command to stop the Docker container on the instances that are being terminated. The command sends the SIGTERM signal, then it sends the SIGKILL signal thirty seconds later.

If you update the endpoint (by calling the [UpdateEndpoint](#) API), SageMaker launches another set of ML compute instances and runs the Docker containers that contain your inference code on them. Then it runs a command to stop the previous Docker containers. To stop a Docker container, command sends the SIGTERM signal, then it sends the SIGKILL signal 30 seconds later.

- SageMaker uses the container definition that you provided in your [CreateModel](#) request to set environment variables and the DNS hostname for the container as follows:
  - It sets environment variables using the `ContainerDefinition.Environment` string-to-string map.
  - It sets the DNS hostname using the `ContainerDefinition.ContainerHostname`.
- If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your `CreateEndpointConfig` request), make sure that your containers are nvidia-docker compatible. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see [NVIDIA/nvidia-docker](#).
- You can't use the `tini` initializer as your entry point in SageMaker containers because it gets confused by the `train` and `serve` arguments.

## How SageMaker Loads Your Model Artifacts

In your [CreateModel](#) request, the container definition includes the `ModelDataUrl` parameter, which identifies the S3 location where model artifacts are stored. SageMaker uses this information to determine from where to copy the model artifacts. It copies the artifacts to the `/opt/ml/model` directory for use by your inference code.

The `ModelDataUrl` must point to a tar.gz file. Otherwise, SageMaker won't download the file.

If you trained your model in SageMaker, the model artifacts are saved as a single compressed tar file in Amazon S3. If you trained your model outside SageMaker, you need to create this single compressed tar file and save it in a S3 location. SageMaker decompresses this tar file into `/opt/ml/model` directory before your container starts.

## How Containers Serve Requests

Containers need to implement a web server that responds to `/invocations` and `/ping` on port 8080.

## How Your Container Should Respond to Inference Requests

To obtain inferences, the client application sends a POST request to the SageMaker endpoint. For more information, see the [InvokeEndpoint](#) API. SageMaker passes the request to the container, and returns the inference result from the container to the client. Note the following:

- SageMaker strips all `POST` headers except those supported by `InvokeEndpoint`. SageMaker might add additional headers. Inference containers must be able to safely ignore these additional headers.
- To receive inference requests, the container must have a web server listening on port 8080 and must accept `POST` requests to the `/invocations` endpoint.
- A customer's model containers must accept socket connection requests within 250 ms.

- A customer's model containers must respond to requests within 60 seconds. The model itself can have a maximum processing time of 60 seconds before responding to the /invocations. If your model is going to take 50-60 seconds of processing time, the SDK socket timeout should be set to be 70 seconds.

## How Your Container Should Respond to Health Check (Ping) Requests

The `CreateEndpoint` and `UpdateEndpoint` API calls result in SageMaker starting new inference containers. Soon after container startup, SageMaker starts sending periodic GET requests to the /ping endpoint.

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the /invocations endpoint.

If the container does not begin to pass health checks, by consistently responding with 200s, during the 4 minutes after startup, `CreateEndpoint` will fail, leaving the endpoint in a failed state, and the update requested by `UpdateEndpoint` will not be completed.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on /ping attempts is 2 seconds.

## Use a Private Docker Registry for Real-Time Inference Containers

Amazon SageMaker hosting enables you to use images stored in Amazon ECR to build your containers for real-time inference by default. Optionally, you can build containers for real-time inference from images in a private Docker registry. The private registry must be accessible from an Amazon VPC in your account. Models that you create based on the images stored in your private Docker registry must be configured to connect to the same VPC where the private Docker registry is accessible. For information about connecting your model to a VPC, see [Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC \(p. 2510\)](#).

Your Docker registry must be secured with a TLS certificate from a known public certificate authority (CA).

### Note

Your private Docker registry must allow inbound traffic from the security groups you specify in the VPC configuration for your model, so that SageMaker hosting is able to pull model images from your registry.

SageMaker can pull model images from DockerHub if there's a path to the open internet inside your VPC.

### Topics

- [Store Images in a Private Docker Registry other than Amazon Elastic Container Registry \(p. 2169\)](#)
- [Use an Image from a Private Docker Registry for Real-time Inference \(p. 2170\)](#)
- [Allow SageMaker to authenticate to a private Docker registry \(p. 2171\)](#)
- [Create the Lambda function \(p. 2171\)](#)
- [Give your execution role permission to Lambda \(p. 2172\)](#)
- [Create an interface VPC endpoint for Lambda \(p. 2172\)](#)

### [Store Images in a Private Docker Registry other than Amazon Elastic Container Registry](#)

To use a private Docker registry to store your images for SageMaker real-time inference, create a private registry that is accessible from your Amazon VPC. For information about creating a Docker registry,

see [Deploy a registry server](#) in the Docker documentation. The Docker registry must comply with the following:

- The registry must be a [Docker Registry HTTP API V2](#) registry.
- The Docker registry must be accessible from the same VPC that you specify in the `VpcConfig` parameter that you specify when you create your model.

## Use an Image from a Private Docker Registry for Real-time Inference

When you create a model and deploy it to SageMaker hosting, you can specify that it use an image from your private Docker registry to build the inference container. Specify this in the `ImageConfig` object in the `PrimaryContainer` parameter that you pass to a call to the [create\\_model](#) function.

### To use an image stored in your private Docker registry for your inference container

1. Create the image configuration object and specify a value of `Vpc` for the `RepositoryAccessMode` field.

```
image_config = {
    'RepositoryAccessMode': 'Vpc'
}
```

2. If your private Docker registry requires authentication, add a `RepositoryAuthConfig` object to the image configuration object. For the `RepositoryCredentialsProviderArn` field of the `RepositoryAuthConfig` object, specify the Amazon Resource Name (ARN) of an Amazon Lambda function that provides credentials that allows SageMaker to authenticate to your private Docker Registry. For information about how to create the Lambda function to provide authentication, see [Allow SageMaker to authenticate to a private Docker registry \(p. 2171\)](#).

```
image_config = {
    'RepositoryAccessMode': 'Vpc',
    'RepositoryAuthConfig': {
        'RepositoryCredentialsProviderArn':
            'arn:aws:lambda:Region:Acct:function:FunctionName'
    }
}
```

3. Create the primary container object that you want to pass to `create_model`, using the image configuration object that you created in the previous step.

```
primary_container = {
    'ContainerHostname': 'ModelContainer',
    'Image': 'myteam.myorg.com/docker-local/my-inference-image:latest',
    'ImageConfig': image_config
}
```

4. Specify the model name and the execution role that you want to pass to `create_model`.

```
model_name = 'vpc-model'
execution_role_arn = 'arn:aws:iam::123456789012:role/SageMakerExecutionRole'
```

5. Specify one or more security groups and subnets for the VPC configuration for your model. Your private Docker registry must allow inbound traffic from the security groups that you specify. The subnets that you specify must be in the same VPC as your private Docker registry.

```
vpc_config = {
    'SecurityGroupIds': ['sg-0123456789abcdef0'],
    'Subnets': ['subnet-0123456789abcdef0', 'subnet-0123456789abcdef1']
```

```
}
```

6. Get a Boto3 SageMaker client.

```
import boto3
sm = boto3.client('sagemaker')
```

7. Create the model by calling `create_model`, using the values you specified in the previous steps for the `PrimaryContainer` and `VpcConfig` parameters.

```
try:
    resp = sm.create_model(
        ModelName=model_name,
        PrimaryContainer=primary_container,
        ExecutionRoleArn=execution_role_arn,
        VpcConfig=vpc_config,
    )
except Exception as e:
    print(f'error calling CreateModel operation: {e}')
else:
    print(resp)
```

8. Finally, call `create_endpoint_config` and `create_endpoint` to create the hosting endpoint, using the model that you created in the previous step.

```
endpoint_config_name = 'my-endpoint-config'
sm.create_endpoint_config(
    EndpointConfigName=endpoint_config_name,
    ProductionVariants=[
        {
            'VariantName': 'MyVariant',
            'ModelName': model_name,
            'InitialInstanceCount': 1,
            'InstanceType': 'ml.t2.medium'
        },
    ],
)
endpoint_name = 'my-endpoint'
sm.create_endpoint(
    EndpointName=endpoint_name,
    EndpointConfigName=endpoint_config_name,
)
sm.describe_endpoint(EndpointName=endpoint_name)
```

## Allow SageMaker to authenticate to a private Docker registry

To pull an inference image from a private Docker registry that requires authentication, create an Amazon Lambda function that provides credentials, and provide the Amazon Resource Name (ARN) of the Lambda function when you call `create_model`. When SageMaker runs `create_model`, it calls the Lambda function that you specified to get credentials to authenticate to your Docker registry.

### Create the Lambda function

Create an Amazon Lambda function that returns a response with the following form:

```
def handler(event, context):
    response = {
        "Credentials": {"Username": "username", "Password": "password"}
```

```
    }
    return response
```

Depending on how you set up authentication for your private Docker registry, the credentials that your Lambda function returns can mean either of the following:

- If you set up your private Docker registry to use basic authentication, this is the *username* and *password* to authenticate to the registry.
- If you set up your private Docker registry to use bearer token authentication, the *username* and *password* are sent to your authorization server, which returns a Bearer token that can then be used to authenticate to the private Docker registry.

### Give your execution role permission to Lambda

The execution role that you use to call `create_model` must have permissions to call Amazon Lambda functions. Add the following to the permissions policy of your execution role.

```
{
  "Effect": "Allow",
  "Action": [
    "lambda:InvokeFunction"
  ],
  "Resource": [
    "arn:aws:lambda:*::*:function:*myLambdaFunction*"
  ]
}
```

Where `myLambdaFunction` is the name of your Lambda function. For information about editing a role permissions policy, see [Modifying a role permissions policy \(console\)](#) in the *Amazon Identity and Access Management User Guide*.

#### Note

An execution role with the `AmazonSageMakerFullAccess` managed policy attached to it has permission to call any Lambda function with **SageMaker** in its name.

### Create an interface VPC endpoint for Lambda

Create an interface endpoint so that your Amazon VPC can communicate with your Amazon Lambda function without sending traffic over the internet. For information about how to do this, see [Configuring interface VPC endpoints for Lambda](#) in the *Amazon Lambda Developer Guide*.

SageMaker hosting sends a request through your VPC to `lambda.region.amazonaws.com`, to call your Lambda function. If you choose Private DNS Name when you create your interface endpoint, Amazon Route 53 routes the call to the Lambda interface endpoint. If you use a different DNS provider, make sure to map `lambda.region.amazonaws.com` to your Lambda interface endpoint.

## Use Your Own Inference Code with Batch Transform

This section explains how Amazon SageMaker interacts with a Docker container that runs your own inference code for batch transform. Use this information to write inference code and create a Docker image.

### Topics

- [How SageMaker Runs Your Inference Image \(p. 2173\)](#)
- [How SageMaker Loads Your Model Artifacts \(p. 2173\)](#)
- [How Containers Serve Requests \(p. 2174\)](#)
- [How Your Container Should Respond to Inference Requests \(p. 2174\)](#)

- [How Your Container Should Respond to Health Check \(Ping\) Requests \(p. 2175\)](#)

## How SageMaker Runs Your Inference Image

To configure a container to run as an executable, use an `ENTRYPOINT` instruction in a Dockerfile. Note the following:

- For batch transforms, SageMaker runs the container as:

```
docker run image serve
```

SageMaker overrides default `CMD` statements in a container by specifying the `serve` argument after the image name. The `serve` argument overrides arguments that you provide with the `CMD` command in the Dockerfile.

- We recommend that you use the `exec` form of the `ENTRYPOINT` instruction:

```
ENTRYPOINT [ "executable", "param1", "param2" ]
```

For example:

```
ENTRYPOINT [ "python", "k_means_inference.py" ]
```

- SageMaker sets environment variables specified in [CreateModel](#) and [CreateTransformJob](#) on your container. Additionally, the following environment variables are populated:
  - `SAGEMAKER_BATCH` is always set to `true` when the container runs in Batch Transform.
  - `SAGEMAKER_MAX_PAYLOAD_IN_MB` is set to the largest size payload that is sent to the container via HTTP.
  - `SAGEMAKER_BATCH_STRATEGY` is set to `SINGLE_RECORD` when the container is sent a single record per call to invocations and `MULTI_RECORD` when the container gets as many records as will fit in the payload.
  - `SAGEMAKER_MAX_CONCURRENT_TRANSFORMS` is set to the maximum number of /invocations requests that can be opened simultaneously.

### Note

The last three environment variables come from the API call made by the user. If the user doesn't set values for them, they aren't passed. In that case, either the default values or the values requested by the algorithm (in response to the `/execution-parameters`) are used.

- If you plan to use GPU devices for model inferences (by specifying GPU-based ML compute instances in your [CreateTransformJob](#) request), make sure that your containers are nvidia-docker compatible. Don't bundle NVIDIA drivers with the image. For more information about nvidia-docker, see [NVIDIA/nvidia-docker](#).
- You can't use the `init` initializer as your entry point in SageMaker containers because it gets confused by the `train` and `serve` arguments.

## How SageMaker Loads Your Model Artifacts

In a [CreateModel](#) request, container definitions include the `ModelDataUrl` parameter, which identifies the location in Amazon S3 where model artifacts are stored. When you use SageMaker to run inferences, it uses this information to determine from where to copy the model artifacts. It copies the artifacts to the `/opt/ml/model` directory in the Docker container for use by your inference code.

The `ModelDataUrl` parameter must point to a tar.gz file. Otherwise, SageMaker can't download the file. If you train a model in SageMaker, it saves the artifacts as a single compressed tar file in Amazon S3. If you train a model in another framework, you need to store the model artifacts in Amazon S3 as a compressed tar file. SageMaker decompresses this tar file and saves it in the `/opt/ml/model` directory in the container before the batch transform job starts.

## How Containers Serve Requests

Containers must implement a web server that responds to invocations and ping requests on port 8080. For batch transforms, you have the option to set algorithms to implement execution-parameters requests to provide a dynamic runtime configuration to SageMaker. SageMaker uses the following endpoints:

- `ping`—Used to periodically check the health of the container. SageMaker waits for an HTTP 200 status code and an empty body for a successful ping request before sending an invocations request. You might use a ping request to load a model into memory to generate inference when invocations requests are sent.
- (Optional) `execution-parameters`—Allows the algorithm to provide the optimal tuning parameters for a job during runtime. Based on the memory and CPUs available for a container, the algorithm chooses the appropriate `MaxConcurrentTransforms`, `BatchStrategy`, and `MaxPayloadInMB` values for the job.

Before calling the invocations request, SageMaker attempts to invoke the execution-parameters request. When you create a batch transform job, you can provide values for the `MaxConcurrentTransforms`, `BatchStrategy`, and `MaxPayloadInMB` parameters. SageMaker determines the values for these parameters using this order of precedence:

1. The parameter values that you provide when you create the `CreateTransformJob` request.
2. The values that the model container returns when SageMaker invokes the execution-parameters endpoint>
3. The default parameter values, listed in the following table.

Parameter	Default Values
<code>MaxConcurrentTransforms</code>	1
<code>BatchStrategy</code>	<code>MULTI_RECORD</code>
<code>MaxPayloadInMB</code>	6

The response for a GET execution-parameters request is a JSON object with keys for `MaxConcurrentTransforms`, `BatchStrategy`, and `MaxPayloadInMB` parameters. This is an example of a valid response:

```
{
  "MaxConcurrentTransforms": 8,
  "BatchStrategy": "MULTI_RECORD",
  "MaxPayloadInMB": 6
}
```

## How Your Container Should Respond to Inference Requests

To obtain inferences, Amazon SageMaker sends a POST request to the inference container. The POST request body contains data from Amazon S3. Amazon SageMaker passes the request to the container, and returns the inference result from the container, saving the data from the response to Amazon S3.

To receive inference requests, the container must have a web server listening on port 8080 and must accept POST requests to the /invocations endpoint. Your model containers must respond to requests within 600 seconds.

## How Your Container Should Respond to Health Check (Ping) Requests

The simplest requirement on the container is to respond with an HTTP 200 status code and an empty body. This indicates to SageMaker that the container is ready to accept inference requests at the /invocations endpoint.

While the minimum bar is for the container to return a static 200, a container developer can use this functionality to perform deeper checks. The request timeout on /ping attempts is 2 seconds.

# Example Notebooks: Use Your Own Algorithm or Model

The following Jupyter notebooks show how to use your own algorithms or pretrained models from an Amazon SageMaker notebook instance. For links to the GitHub repositories with the prebuilt Dockerfiles for the TensorFlow, MXNet, Chainer, and PyTorch frameworks and instructions on using the Amazon SDK for Python (Boto3) estimators to run your own training algorithms on SageMaker Learner and your own models on SageMaker hosting, see [Prebuilt SageMaker Docker Images for Deep Learning \(p. 2135\)](#)

## Setup

1. Create a SageMaker notebook instance. For instructions on how to create and access Jupyter notebook instances, see [Use Amazon SageMaker Notebook Instances \(p. 120\)](#).
2. Open the notebook instance you created.
3. Choose the **SageMaker Examples** tab for a list of all SageMaker example notebooks.
4. Open the sample notebooks from the **Advanced Functionality** section in your notebook instance or from GitHub using the provided links. To open a notebook, choose its **Use** tab, then choose **Create copy**.

## Host Models Trained in Scikit-learn

To learn how to host models trained in Scikit-learn for making predictions in SageMaker by injecting them into first-party k-means and XGBoost containers, see the following sample notebooks.

- [kmeans\\_bring\\_your\\_own\\_model](#)
- [xgboost\\_bring\\_your\\_own\\_model](#)

## Package TensorFlow and Scikit-learn Models for Use in SageMaker

To learn how to package algorithms that you have developed in TensorFlow and scikit-learn frameworks for training and deployment in the SageMaker environment, see the following notebooks. They show you how to build, register, and deploy your own Docker containers using Dockerfiles.

- [tensorflow\\_bring\\_your\\_own](#)

- [scikit\\_bring\\_your\\_own](#)

## Train and Deploy a Neural Network on SageMaker

To learn how to train a neural network locally using MXNet or TensorFlow, and then create an endpoint from the trained model and deploy it on SageMaker, see the following notebooks. The MXNet model is trained to recognize handwritten numbers from the MNIST dataset. The TensorFlow model is trained to classify irises.

- [mxnet\\_mnist\\_byom](#)
- [tensorflow\\_iris\\_byom](#)

## Training Using Pipe Mode

To learn how to use a Dockerfile to build a container that calls the `train.py` script and uses pipe mode to custom train an algorithm, see the following notebook. In pipe mode, the input data is transferred to the algorithm while it is training. This can decrease training time compared to using file mode.

- [pipe\\_bring\\_your\\_own](#)

## Bring Your Own R Model

To learn how to use an R container to train and host a model with the R kernel installed in a notebook, see the following notebook. To take advantage of the Amazon SDK for Python (Boto3), we use Python within the notebook. You can achieve the same results in R by invoking command line arguments.

- [r\\_bring\\_your\\_own](#)

## Extend a Prebuilt PyTorch Container Image

To learn how to extend a prebuilt SageMaker PyTorch container image when you have additional functional requirements for your algorithm or model that the prebuilt Docker image doesn't support, see the following notebook.

- [pytorch\\_extending\\_our\\_containers](#)

## Train and Debug Training Jobs on a Custom Container

To learn how to train and debug training jobs using SageMaker Debugger, see the following notebook. A training script provided through this example uses the TensorFlow Keras ResNet 50 model and the CIFAR10 dataset. A Docker custom container is built with the training script and pushed to Amazon ECR. While the training job is running, Debugger collects tensor outputs and identifies debugging problems. With `smdebug` client library tools, you can set a `smdebug` trial object that calls the training job and debugging information, check the training and Debugger rule status, and retrieve tensors saved in an Amazon S3 bucket to analyze training issues.

- [build\\_your\\_own\\_container\\_with\\_debugger](#)

## Troubleshooting your Docker containers

The following are common errors that you might run into when using Docker containers with SageMaker. Each error is followed by a solution to the error.

- **Error: SageMaker has lost the Docker daemon.**

To fix this error, restart Docker using the following command.

```
sudo service docker restart
```

# SageMaker Workflows

You can manage your Amazon SageMaker training and inference workflows using Amazon SageMaker Studio and the Amazon SageMaker Python SDK. With the available tools, you can simplify your SageMaker process and integrate it into your existing project.

The following workflow technologies are supported.

- [Amazon SageMaker Model Building Pipelines \(p. 2178\)](#): SageMaker's tool for building and managing end-to-end ML pipelines.
- [Airflow Workflows](#): SageMaker APIs to export configurations for creating and managing Airflow workflows.
- [Kubernetes Orchestration \(p. 2263\)](#): SageMaker custom operators for your Kubernetes cluster, as well as custom components for Kubeflow Pipelines.
- [Amazon Step Functions](#): Create multi-step machine learning workflows in Python that orchestrate SageMaker infrastructure without having to provision your resources separately.

For more information on managing SageMaker training and inference, see [Amazon SageMaker Python SDK Workflows](#).

## Topics

- [Amazon SageMaker Model Building Pipelines \(p. 2178\)](#)
- [Automate MLOps with SageMaker Projects \(p. 2232\)](#)
- [Amazon SageMaker ML Lineage Tracking \(p. 2256\)](#)
- [Kubernetes Orchestration \(p. 2263\)](#)

## Amazon SageMaker Model Building Pipelines

Amazon SageMaker Model Building Pipelines is a tool for building machine learning pipelines that take advantage of direct SageMaker integration. Because of this integration, you can create a pipeline and set up SageMaker Projects for orchestration using a tool that handles much of the step creation and management for you. SageMaker Pipelines provides the following advantages over other Amazon workflow offerings:

### SageMaker Integration

SageMaker Pipelines is integrated directly with SageMaker, so you don't need to interact with any other Amazon services. You also don't need to manage any resources because SageMaker Pipelines is a fully managed service, which means that it creates and manages resources for you.

### SageMaker Python SDK Integration

Because SageMaker Pipelines is integrated with the SageMaker Python SDK, you can create your pipelines programmatically using a high-level Python interface that you might already be familiar with. To view the SageMaker Python SDK documentation, see [Pipelines](#).

### SageMaker Studio Integration

SageMaker Studio offers an environment to manage the end-to-end SageMaker Pipelines experience. Using Studio, you can bypass the Amazon console for your entire workflow management. For more information on managing SageMaker Pipelines from SageMaker Studio, see [View, Track, and Execute SageMaker Pipelines in SageMaker Studio \(p. 2217\)](#).

### Data Lineage Tracking

With SageMaker Pipelines you can track the history of your data within the pipeline execution. Amazon SageMaker ML Lineage Tracking lets you analyze where the data came from, where it was used as an input, and the outputs that were generated from it. For example, you can view the models created from an individual dataset, and you can view the datasets that went into creating an individual model. For more information, see [Amazon SageMaker ML Lineage Tracking \(p. 2256\)](#).

### Step Reuse

With SageMaker Pipelines, you can designate steps for caching. When a step is cached, it is indexed for reuse later if the same step is executed again. As a result, you can reuse the output from previous step executions of the same step in the same pipeline without having to run the step again. For more information on step caching, see [Caching Pipeline Steps \(p. 2192\)](#).

### Topics

- [SageMaker Pipelines Overview \(p. 2179\)](#)
- [Create and Manage SageMaker Pipelines \(p. 2201\)](#)

## SageMaker Pipelines Overview

An Amazon SageMaker Model Building Pipelines pipeline is a series of interconnected steps that is defined by a JSON pipeline definition. This pipeline definition encodes a pipeline using a directed acyclic graph (DAG). This DAG gives information on the requirements for and relationships between each step of your pipeline. The structure of a pipeline's DAG is determined by the data dependencies between steps. These data dependencies are created when the properties of a step's output are passed as the input to another step. The following image is an example of a pipeline DAG:

The following topics describe fundamental SageMaker Pipelines concepts. For a tutorial describing the implementation of these concepts, see [Create and Manage SageMaker Pipelines \(p. 2201\)](#).

#### Topics

- [Pipeline Structure \(p. 2181\)](#)
- [Access Management \(p. 2181\)](#)
- [Pipeline Parameters \(p. 2182\)](#)
- [Pipeline Steps \(p. 2183\)](#)
- [Property Files and JsonGet \(p. 2191\)](#)
- [Caching Pipeline Steps \(p. 2192\)](#)
- [Amazon EventBridge Integration \(p. 2193\)](#)

- [Amazon SageMaker Experiments Integration \(p. 2195\)](#)
- [SageMaker Pipelines Quotas \(p. 2198\)](#)
- [Troubleshooting Amazon SageMaker Model Building Pipelines \(p. 2200\)](#)

## Pipeline Structure

A pipeline instance is composed of a name, parameters, and steps. Pipeline names must be unique within an (account, region) pair. All parameters used in step definitions must be defined in the pipeline. Steps passed into the pipeline don't need to be listed in the order of execution because the steps themselves define the relationships between them using data dependencies. The SageMaker Pipelines service resolves the relationships between steps in the data dependency DAG to create a series of steps that the execution completes. The following is an example of a pipeline structure.

```
from sagemaker.workflow.pipeline import Pipeline

pipeline_name = f"AbalonePipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_type,
        processing_instance_count,
        training_instance_type,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)
```

## Access Management

The following sections describe the Amazon Identity and Access Management (IAM) requirements for Amazon SageMaker Model Building Pipelines. For an example of how you can implement these permissions, see [Prerequisites \(p. 2203\)](#).

### Topics

- [Pipeline Role Permissions \(p. 2181\)](#)
- [Pipeline Step Permissions \(p. 2182\)](#)
- [Service Control Policies with Pipelines \(p. 2182\)](#)

## Pipeline Role Permissions

Your pipeline requires an IAM pipeline execution role that is passed to SageMaker Pipelines when you create a pipeline. The role for the SageMaker instance that is creating the pipeline must have the `iam:PassRole` permission for the pipeline execution role in order to pass it. For more information on IAM roles, see [IAM Roles](#).

Your pipeline execution role requires the following permissions:

- To pass any role to a SageMaker job within a pipeline, the `iam:PassRole` permission for the role that is being passed.
- `Create and Describe` permissions for each of the job types in the pipeline.
- Amazon S3 permissions to use the `JsonGet` function. You control access to your Amazon S3 resources using resource-based policies and identity-based policies. A resource-based policy is applied to your

Amazon S3 bucket and grants SageMaker Pipelines access to the bucket. An identity-based policy gives your pipeline the ability to make Amazon S3 calls from your account. For more information on resource-based policies and identity-based policies, see [Identity-based policies and resource-based policies](#).

```
{  
    "Action": [  
        "s3:GetObject",  
        "s3:HeadObject"  
    ],  
    "Resource": "arn:aws:s3:::<your-bucket-arn>/*",  
    "Effect": "Allow"  
}
```

## Pipeline Step Permissions

SageMaker Pipelines include steps that run SageMaker jobs. In order for the pipeline steps to run these jobs, they require an IAM role in your account that provides access for the needed resource. This role is passed to the SageMaker service principal by your pipeline. For more information on IAM roles, see [IAM Roles](#).

By default, each step takes on the pipeline execution role. You can optionally pass a different role to any of the steps in your pipeline. This ensures that the code in each step does not have the ability to impact resources used in other steps unless there is a direct relationship between the two steps specified in the pipeline definition. You pass these roles when defining the processor or estimator for your step. For examples of how to include these roles in these definitions, see the [SageMaker Python SDK documentation](#).

## Service Control Policies with Pipelines

Service control policies (SCPs) are a type of organization policy that you can use to manage permissions in your organization. SCPs offer central control over the maximum available permissions for all accounts in your organization. By using SageMaker Pipelines within your organization, you can ensure that data scientists manage your pipeline executions without having to interact with the Amazon console.

If you're using a VPC with your SCP that restricts access to Amazon S3, you need to take steps to allow your pipeline to access other Amazon S3 resources.

To allow SageMaker Pipelines to access Amazon S3 outside of your VPC with the `JsonGet` function, update your organization's SCP to ensure that the role using SageMaker Pipelines can access Amazon S3. To do this, create an exception for roles that are being used by the SageMaker Pipelines executor via the pipeline execution role using a principal tag and condition key.

### To allow SageMaker Pipelines to access Amazon S3 outside of your VPC

1. Create a unique tag for your pipeline execution role following the steps in [Tagging IAM users and roles](#).
2. Grant an exception in your SCP using the `Aws:PrincipalTag` IAM condition key for the tag you created. For more information, see [Creating, updating, and deleting service control policies](#).

## Pipeline Parameters

You can introduce variables into your pipeline definition using parameters. Parameters that you define can be referenced throughout your pipeline definition. Parameters have a default value, which you can override by specifying parameter values when starting a pipeline execution. The default value must be an instance matching the parameter type. All parameters used in step definitions must be defined in

your pipeline definition. Amazon SageMaker Model Building Pipelines supports the following parameter types:

- `ParameterString` – Representing a `str` Python type.
- `ParameterInteger` – Representing an `int` Python type.
- `ParameterFloat` – Representing a `float` Python type.

Parameters take the following format:

```
<parameter> = <parameter_type>(  
    name="<parameter_name>",  
    default_value=<default_value>  
)
```

The following shows an example parameter implementation:

```
from sagemaker.workflow.parameters import (  
    ParameterInteger,  
    ParameterString,  
    ParameterFloat  
)  
  
processing_instance_count = ParameterInteger(  
    name="ProcessingInstanceCount",  
    default_value=1  
)
```

You pass the parameter when creating your pipeline as follows:

```
pipeline = Pipeline(  
    name=pipeline_name,  
    parameters=[  
        processing_instance_count  
    steps=[step_process]  
)
```

You can also pass a parameter value that differs from the default value to a pipeline execution as follows:

```
execution = pipeline.start(  
    parameters=dict(  
        ProcessingInstanceType="ml.c5.xlarge",  
        ModelApprovalStatus="Approved"  
    )  
)
```

## Pipeline Steps

SageMaker Pipelines are composed of steps. These steps define the actions that the pipeline takes, and the relationships between steps using properties.

### Topics

- [Step Types \(p. 2184\)](#)
- [Step Properties \(p. 2189\)](#)

- [Data Dependency Between Steps \(p. 2189\)](#)
- [Custom Dependency Between Steps \(p. 2190\)](#)
- [Use a Custom Image in a Step \(p. 2191\)](#)

## Step Types

The following describes the requirements of each step type and provides an example implementation of the step. These are not functional implementations because they don't provide the resource and inputs needed. For a tutorial that implements these steps, see [Create and Manage SageMaker Pipelines \(p. 2201\)](#).

Amazon SageMaker Model Building Pipelines support the following step types:

- [Processing \(p. 2184\)](#)
- [Training \(p. 2185\)](#)
- [Transform \(p. 2186\)](#)
- [CreateModel \(p. 2186\)](#)
- [RegisterModel \(p. 2186\)](#)
- [Condition \(p. 2187\)](#)
- [Callback \(p. 2187\)](#)

### Processing Step

You use a processing step to create a processing job for data processing. For more information on processing jobs, see [Process Data and Evaluate Models](#).

A processing step requires a processor, a Python script that defines the processing code, outputs for processing, and job arguments. The following example shows how to create a `ProcessingStep` definition. For more information on processing step requirements, see the [sagemaker.workflow.steps.ProcessingStep](#) documentation.

```
from sagemaker.sklearn.processing import SKLearnProcessor

sklearn_processor = SKLearnProcessor(framework_version='0.20.0',
                                      role=<role>,
                                      instance_type='ml.m5.xlarge',
                                      instance_count=1)
```

```
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(source=<input_data>, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test")
    ],
    code="abalone/preprocessing.py"
)
```

### Pass runtime parameters

You can pass runtime parameters to a processing step using the [get\\_run\\_args](#) method of the [Amazon SageMaker Python SDK](#). This allows you to use processors besides SKLearnProcessor such as PySparkProcessor and SparkJarProcessor.

The following example shows how to pass runtime parameters from a PySpark processor to a ProcessingStep.

```
from sagemaker.spark.processing import PySparkProcessor

pyspark_processor = PySparkProcessor(framework_version='2.4',
                                     role=<role>,
                                     instance_type='ml.m5.xlarge',
                                     instance_count=1)

from sagemaker.processing import ProcessingInput, ProcessingOutput

run_args = pyspark_processor.get_run_args(
    "preprocess.py",
    inputs=[
        ProcessingInput(source=<input_data>, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test")
    ],
    arguments=None
)

from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=pyspark_processor,
    inputs=run_args.inputs,
    outputs=run_args.outputs,
    job_arguments=run_args.arguments,
    code=run_args.code
)
```

### Training Step

You use a training step to create a training job to train a model. For more information on training jobs, see [Train a Model with Amazon SageMaker](#).

A training step requires an estimator, and training and validation data inputs. The following example shows how to create a TrainingStep definition. For more information on Training step requirements, see the [sagemaker.workflow.steps.TrainingStep](#) documentation.

```
from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep

step_train = TrainingStep(
    name="TrainAbaloneModel",
    estimator=xgb_train,
    inputs={
        "train": TrainingInput(
```

```
s3_data=step_process.properties.ProcessingOutputConfig.Outputs[
    "train"
].S3Output.S3Uri,
content_type="text/csv"
),
"validation": TrainingInput(
    s3_data=step_process.properties.ProcessingOutputConfig.Outputs[
        "validation"
].S3Output.S3Uri,
content_type="text/csv"
)
}
)
```

## Transform Step

You use a transform step for batch transformation to run inference on an entire dataset. For more information on batch transformation, see [Run Batch Transforms with Inference Pipelines](#).

A transform step requires a transformer, and the data to run batch transformation on. The following example shows how to create a `TransformStep` definition. For more information on `TransformStep` requirements, see the [sagemaker.workflow.steps.TransformStep](#) documentation.

```
from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep

step_transform = TransformStep(
    name="AbaloneTransform",
    transformer=transformer,
    inputs=TransformInput(data=batch_data)
)
```

## CreateModel Step

You use a `CreateModel` step to create a SageMaker Model. For more information on SageMaker Models, see [Train a Model with Amazon SageMaker](#).

A `CreateModel` step requires model artifacts, and information on the SageMaker instance type that you need to use to create the model. The following example shows how to create a `CreateModel` step definition. For more information on `CreateModel` step requirements, see the [sagemaker.workflow.steps.CreateModelStep](#) documentation.

```
from sagemaker.workflow.steps import CreateModelStep

step_create_model = CreateModelStep(
    name="AbaloneCreateModel",
    model=model,
    inputs=inputs
)
```

## RegisterModel Step

You use a `RegisterModel` step to register a model to a model group. For more information on registering models, see [Register and Deploy Models with Model Registry \(p. 2003\)](#).

A `RegisterModel` step requires an estimator, model data output from training, and a model package group name to associate the model package with. The following example shows how to create a `RegisterModel` definition. For more information on `RegisterModel` step requirements, see the [sagemaker.workflow.step\\_collections.RegisterModel](#) documentation.

```
from sagemaker.workflow.step_collections import RegisterModel

step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=["text/csv"],
    response_types=["text/csv"],
    inference_instances=["ml.t2.medium", "ml.m5.xlarge"],
    transform_instances=["ml.m5.xlarge"],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
)
```

## Condition Step

You use a condition step to evaluate the condition of step properties to assess which action should be taken next in the pipeline.

A condition step requires a list of conditions, and a list of steps to execute if the condition evaluates to `true` and a list of steps to execute if the condition evaluates to `false`. The following example shows how to create a Condition step definition. For more information on Condition step requirements, see the [sagemaker.workflow.condition\\_step.ConditionStep](#) documentation.

## Limitations

- SageMaker Pipelines doesn't support the use of nested condition steps. You can't pass a condition step as the input for another condition step.
- A condition step can't use identical steps in both branches. If you need the same step functionality in both branches, duplicate the step and give it a different name.

```
from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
from sagemaker.workflow.condition_step import (
    ConditionStep,
    JsonGet
)

cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step=step_eval,
        property_file=evaluation_report,
        json_path="regression_metrics.mse.value"
    ),
    right=6.0
)

step_cond = ConditionStep(
    name="AbaloneMSECond",
    conditions=[cond_lte],
    if_steps=[step_register, step_create_model, step_transform],
    else_steps=[]
)
```

## Callback Step

You can use a callback step to incorporate additional processes and Amazon services into your workflow that aren't directly provided by Amazon SageMaker Model Building Pipelines. When a callback step runs, the following procedure occurs:

- SageMaker Pipelines sends a message to a customer-specified Amazon Simple Queue Service (Amazon SQS) queue. The message contains a SageMaker Pipelines-generated token and a customer-supplied list of input parameters. After sending the message, SageMaker Pipelines waits for a response from the customer.
- The customer retrieves the message from the Amazon SQS queue and starts their custom process.
- When the process finishes, the customer calls one of the following APIs and submits the SageMaker Pipelines-generated token:
  - [SendPipelineExecutionStepSuccess](#) – along with a list of output parameters
  - [SendPipelineExecutionStepFailure](#) – along with a failure reason
- The API call causes SageMaker Pipelines to either continue the pipeline execution or fail the execution.

For more information on Callback step requirements, see the [sagemaker.workflow.callback\\_step](#) documentation.

### Stopping Behavior

A pipeline execution won't stop while a callback step is running.

When you call [StopPipelineExecution](#) on a pipeline execution with a running callback step, SageMaker Pipelines sends an additional Amazon SQS message to the specified SQS queue. The body of the SQS message contains a "Status" field which is set to "Stopping".

You should add logic to your Amazon SQS message consumer to take any needed action (for example, resource cleanup) upon receipt of the message followed by a call to [SendPipelineExecutionStepSuccess](#) or [SendPipelineExecutionStepFailure](#).

Only when SageMaker Pipelines receives one of these calls will it stop the pipeline execution.

#### Important

Callback steps were introduced in Amazon SageMaker Python SDK v2.45.0 and Amazon SageMaker Studio v3.6.2. You must update Studio before you use a callback step or the pipeline DAG doesn't display. To update Studio, see [Update SageMaker Studio \(p. 117\)](#).

The following sample demonstrates an implementation of the preceding procedure.

```
from sagemaker.workflow.callback_step import CallbackStep

step_callback = CallbackStep(
    name="MyCallbackStep",
    sqs_queue_url="https://sqs.us-east-2.amazonaws.com/012345678901/MyCallbackQueue",
    inputs={...},
    outputs=[...]
)

callback_handler_code = '
    import boto3
    import json

    def handler(event, context):
        sagemaker_client=boto3.client("sagemaker")

        for record in event["Records"]:
            payload=json.loads(record["body"])
            token=payload["token"]

            # Custom processing

            # Call SageMaker to complete the step
            sagemaker_client.send_pipeline_execution_step_success(
```

```
        CallbackToken=token,  
        OutputParameters={...}  
    )  
,
```

## Stopping Behavior

A pipeline execution won't stop while a callback step is running.

When you call [StopPipelineExecution](#) on a pipeline execution with a running callback step, SageMaker Pipelines sends an additional Amazon SQS message to the specified SQS queue. The body of the SQS message contains a "Status" field which is set to "Stopping".

You should add logic to your Amazon SQS message consumer to take any needed action (for example, resource cleanup) upon receipt of the message followed by a call to [SendPipelineExecutionStepSuccess](#) or [SendPipelineExecutionStepFailure](#).

Only when SageMaker Pipelines receives one of these calls will it stop the pipeline execution.

## Step Properties

The `properties` attribute is used to add data dependencies between steps in the pipeline. These data dependencies are then used by SageMaker Pipelines to construct the DAG from the pipeline definition. These properties can be referenced as placeholder values and are resolved at runtime.

The `properties` attribute of a SageMaker Pipelines step matches the object returned by a `Describe` call for the corresponding SageMaker job type. For each job type, the `Describe` call returns the following response object:

- `ProcessingStep` – [DescribeProcessingJob](#)
- `TrainingStep` – [DescribeTrainingJob](#)
- `TransformStep` – [DescribeTransformJob](#)

## Data Dependency Between Steps

You define the structure of your DAG by specifying the data relationships between steps. To create data dependencies between steps, pass the properties of one step as the input to another step in the pipeline. The step receiving the input isn't started until after the step providing the input finishes execution.

A data dependency uses JsonPath notation in the following format. This format traverses the JSON property file, which means you can append as many `<property>` instances as needed to reach the desired nested property in the file. For more information on JsonPath notation, see the [JsonPath repo](#).

```
<step_name>.properties.<property>.<property>
```

The following shows how to specify an Amazon S3 bucket using the `ProcessingOutputConfig` property of a processing step.

```
step_process.properties.ProcessingOutputConfig.Outputs["train_data"].S3Output.S3Uri
```

To create the data dependency, pass the bucket to a training step as follows.

```
step_train = TrainingStep(  
    name="CensusTrain",
```

```
estimator=sklearn_train,
inputs=TrainingInput(
    s3_data=step_process.properties.ProcessingOutputConfig.Outputs[
        "train_data"].S3Output.S3Uri
)
)
```

## Custom Dependency Between Steps

When you specify a data dependency, SageMaker Pipelines provides the data connection between the steps. Alternatively, one step can access the data from a previous step without directly using SageMaker Pipelines. In this case, you can create a custom dependency that tells SageMaker Pipelines not to start a step until after another step has finished executing. You create a custom dependency by specifying a step's `DependsOn` attribute.

As an example, the following defines a step C that starts only after both step A and step B finish executing.

```
{
    'Steps': [
        {'Name': 'A', ...},
        {'Name': 'B', ...},
        {'Name': 'C', 'DependsOn': ['A', 'B']}
    ]
}
```

SageMaker Pipelines throws a validation exception if the dependency would create a cyclic dependency.

The following example creates a training step that starts after a processing step finishes executing.

```
processing_step = ProcessingStep(...)
training_step = TrainingStep(...)

training_step.add_depends_on([processing_step])
```

The following example creates a training step that doesn't start until two different processing steps finish executing.

```
processing_step_1 = ProcessingStep(...)
processing_step_2 = ProcessingStep(...)

training_step = TrainingStep(...)

training_step.add_depends_on([processing_step_1, processing_step_2])
```

The following provides an alternate way to create the custom dependency.

```
training_step.add_depends_on([processing_step_1])
training_step.add_depends_on([processing_step_2])
```

The following example creates a training step that receives input from one processing step and waits for a different processing step to finish executing.

```
processing_step_1 = ProcessingStep(...)
processing_step_2 = ProcessingStep(...)
```

```
training_step = TrainingStep(  
    ...  
    inputs=TrainingInput(  
        s3_data=processing_step_1.properties.ProcessingOutputConfig.Outputs[  
            "train_data"  
        ].S3Output.S3Uri  
    )  
  
    training_step.add_depends_on([processing_step_2])
```

The following example shows how to retrieve a string list of the custom dependencies of a step.

```
custom_dependencies = training_step.depends_on()
```

## Use a Custom Image in a Step

You can use any of the available SageMaker [Deep Learning Container images](#) when you create a step in your pipeline.

You can also create a step using SageMaker S3 applications. A SageMaker S3 application is a tar.gz bundle with one or more Python scripts that can run within that bundle. For more information on application package bundling, see [Deploying directly from model artifacts](#).

You can also use your own container with pipeline steps. Because you can't create an image from within SageMaker Studio, you must create your image using another method before using it with Amazon SageMaker Model Building Pipelines.

To use your own container when creating the steps for your pipeline, include the image URI in the estimator definition. For more information on using your own container with SageMaker, see [Using Docker Containers with SageMaker](#).

## Property Files and JsonGet

You use property files to store information from the output of a processing step. This is particularly useful when analyzing the results of a processing step to decide how a conditional step should be executed. The `JsonGet` function processes a property file and enables you to use JsonPath notation to query the property JSON file. For more information on JsonPath notation, see the [JsonPath repo](#).

To store a property file for later use, you must first create a `PropertyFile` instance with the following format. The `path` parameter is the name of the JSON file that the property file is saved to. `output_name` must match the `output_name` of the `ProcessingOutput` that you define in your processing step. This enables the property file to capture the `ProcessingOutput` in the step.

```
from sagemaker.workflow.properties import PropertyFile  
  
<property_file_instance> = PropertyFile(  
    name=<property_file_name>,  
    output_name=<processingoutput_output_name>,  
    path=<path_to_json_file>  
)
```

When you create your `ProcessingStep` instance, add the `property_files` parameter to list all of the parameter files that the Amazon SageMaker Model Building Pipelines service must index. This saves the property file for later use.

```
property_files=[<property_file_instance>]
```

To use your property file in a condition step, add the `property_file` to the condition that you pass to your condition step as follows. This enables you to query the JSON file for your desired property using the `json_path` parameter.

```
cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step=step_eval,
        property_file=<property_file_instance>,
        json_path="mse"
    ),
    right=6.0
)
```

## Caching Pipeline Steps

When you use step signature caching, before SageMaker Pipelines executes a step, it attempts to find a previous execution of a step that was called with the same arguments. SageMaker Pipelines checks that the call signatures are identical. Pipelines doesn't check whether the data or code that the arguments point to has changed. If a previous execution is found, a cache hit is created. Pipelines then propagates the values from the cache hit during execution, rather than recomputing the step.

Step caching only considers successful executions, so no failed executions are ever reused. When multiple successful executions exist within the timeout period, Pipelines uses the result for the most recent successful execution. If no successful executions match in the timeout period, Pipelines won't reuse any steps. If the executor finds a cache hit for a previous step execution that is still in progress, both steps continue executing and update the cache, if they're successful.

You must opt-in to step caching, otherwise it is off by default. When you enable step caching, you must also define a timeout. This timeout defines how old a previous execution can be to be considered for reuse.

Step caching is only scoped for individual pipelines, so you can't reuse a step from another pipeline. Even if there is a step signature match in the other pipeline, the step is not reused.

Step caching is available for the following step types:

- Training
- Processing
- Transform

## Enabling Step Caching

To enable step caching, you must add a `CacheConfig` property to the step definition.

`CacheConfig` properties use the following format in the pipeline definition file.

```
{
  "CacheConfig": {
    "Enabled": false,
    "ExpireAfter": "<time>"
  }
}
```

The `Enabled` field may be true or false. `ExpireAfter` is a string that defines the timeout period. Any ISO 8601 duration string is a valid `ExpireAfter` value. The `ExpireAfter` duration can contain a

year, month, week, day, hour, and minute value. Each value consists of a number followed by a letter indicating the duration unit it is for. For example:

- "30d" = Thirty days
- "5y" = Five years
- "T16m" = 16 minutes
- "30dT5h" = 30 days and five hours.

The following example shows how to enable caching for a training step using the Amazon SageMaker Python SDK.

```
cache_config = CacheConfig(enable_caching=True, expire_after="PT1H")

step_train = TrainingStep(
    name="TrainAbaloneModel",
    estimator=xgb_train,
    inputs=inputs,
    cache_config=cache_config
)
```

## Amazon EventBridge Integration

You can schedule your Amazon SageMaker Model Building Pipelines executions using [Amazon EventBridge](#). Amazon SageMaker Model Building Pipelines is supported as a target in [Amazon EventBridge](#). This allows you to trigger the execution of your model building pipeline based on any event in your event bus. EventBridge enables you to automate your pipeline executions and respond automatically to events such as training job or endpoint status changes. Events include a new file being uploaded to your Amazon S3 bucket, a change in status of your Amazon SageMaker endpoint due to drift, and [Amazon Simple Notification Service \(SNS\) topics](#).

The following SageMaker Pipelines actions can be automatically triggered:

- `StartPipelineExecution`

For more information on scheduling SageMaker jobs, see [Automating SageMaker with Amazon EventBridge](#).

### Schedule a Pipeline with Amazon EventBridge

To start a pipeline execution with Amazon CloudWatch Events, you must create an EventBridge rule. When you create a rule for events, you specify a target action to take when EventBridge receives an event that matches the rule. When an event matches the rule, EventBridge sends the event to the specified target and triggers the action defined in the rule.

The following tutorials show how to schedule a pipeline execution with EventBridge using the EventBridge console or the Amazon CLI.

#### Prerequisites

- A role that can be assumed by EventBridge with the `SageMaker::StartPipelineExecution` permission. This role can be created automatically if you create a rule from the EventBridge console, otherwise you need to create this role yourself. For information on creating a SageMaker role, see [SageMaker Roles](#).
- An Amazon SageMaker Pipeline to schedule. To create an Amazon SageMaker Pipeline, see [Define a Pipeline](#).

## Create an EventBridge rule using the EventBridge console

The following procedure shows how to create an EventBridge rule using the EventBridge console.

1. Navigate to the [EventBridge console](#).
2. Select Rules on the left hand side.
3. Select Create Rule.
4. Enter a name and description for your rule.
5. Select how you want this rule to be triggered. You have the following choices for your rule:
  - **Event pattern:** Your rule is triggered when an event matching the pattern occurs. You can choose a pre-defined pattern that matches a certain type of event, or you can create a custom pattern. If you select a pre-defined pattern, you can edit the pattern to customize it. For more information on Event patterns, see [Event Patterns in CloudWatch Events](#).
  - **Schedule:** Your rule is triggered regularly on a specified schedule. You can use a fixed-rate schedule that triggers regularly for a specified number of minutes, hour, or weeks. You can also use a [cron expression](#) to create a more fine-grained schedule, such as "the first Monday of each month at 8am." Schedule is not supported on a custom or partner event bus.
6. Select your desired Event bus.
7. Select the target(s) to invoke when an event matches your event pattern or when the schedule is triggered. You can add up to 5 targets per rule. Select SageMaker Pipeline in the target drop-down.
8. Select the pipeline you want to trigger from the pipeline drop-down.
9. Add parameters to pass to your pipeline execution using a name and value pair. Parameter values can be static or dynamic. For more information on Amazon SageMaker Pipeline parameters, see [AWS::Events::Rule SagemakerPipelineParameters](#).
  - Static values are passed to the pipeline execution every time the pipeline is triggered. For example, if `{ "Name": "Instance_type", "Value": "ml.4xlarge" }` is specified in the parameter list, then it will be passed as a parameter in `StartPipelineExecutionRequest` every time EventBridge triggers the pipeline.
  - Dynamic values are specified using a json path. EventBridge parses the value from an event payload, then passes it to the pipeline execution. For example: `$.detail.param.value`
10. Select the role to use for this rule. You can either use an existing role or create a new one.
11. (Optional) Add tags.
12. Select Create to finalize your rule.

Your rule is now in effect and ready to trigger your pipeline executions.

## Create an EventBridge rule using the Amazon CLI

The following procedure shows how to create an EventBridge rule using the Amazon CLI.

1. Create a rule to be triggered. When creating an EventBridge rule using the Amazon CLI, you have two options for how your rule is triggered, event pattern and schedule.
  - **Event pattern:** Your rule is triggered when an event matching the pattern occurs. You can choose a pre-defined pattern that matches a certain type of event, or you can create a custom pattern. If you select a pre-defined pattern, you can edit the pattern to customize it. You can create a rule with event pattern using the following command:

```
aws events put-rule --name <RULE_NAME> ----event-pattern <YOUR_EVENT_PATTERN> --description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>
```

- **Schedule:** Your rule is triggered regularly on a specified schedule. You can use a fixed-rate schedule that triggers regularly for a specified number of minutes, hour, or weeks. You can also use a cron expression to create a more fine-grained schedule, such as “the first Monday of each month at 8am.” Schedule is not supported on a custom or partner event bus. You can create a rule with schedule using the following command:

```
aws events put-rule --name <RULE_NAME> --schedule-expression <YOUR_CRON_EXPRESSION>
--description <RULE_DESCRIPTION> --role-arn <ROLE_TO_EXECUTE_PIPELINE> --tags <TAGS>
```

2. Add target(s) to invoke when an event matches your event pattern or when the schedule is triggered. You can add up to 5 targets per rule. For each target, you must specify:
  - ARN: The resource ARN of your pipeline.
  - Role ARN: The ARN of the role EventBridge should assume to execute the pipeline.
  - Parameters: Amazon SageMaker pipeline parameters to pass.
3. Run the following command to pass a Amazon SageMaker pipeline as a target to your rule using [put-targets](#) :

```
aws events put-targets --rule <RULE_NAME> --event-bus-name <EVENT_BUS_NAME>
--targets "[{\\"Id\\": <ID>, \\"Arn\\": <RESOURCE_ARN>, \\"RoleArn\\": <ROLE_ARN>,
\\\"SageMakerPipelineParameter\\": { \\"SageMakerParameterList\\": [{{\\\"Name\\": <NAME>,
\\\"Value\\": <VALUE>}}]} }]"
```

## Amazon SageMaker Experiments Integration

Amazon SageMaker Model Building Pipelines is closely integrated with Amazon SageMaker Experiments. By default, when SageMaker Pipelines creates and executes a pipeline, the following SageMaker Experiments entities are created if they don't exist:

- An experiment for the pipeline
- A trial for every execution of the pipeline
- A trial component that's added to the trial for each SageMaker job created in a pipeline execution step

You can compare metrics such as model training accuracy across multiple pipeline executions just as you can compare such metrics across multiple trials of a SageMaker model training experiment.

The following sample shows the relevant parameters of the [Pipeline](#) class in the [Amazon SageMaker Python SDK](#).

```
Pipeline(
    name="MyPipeline",
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        ExecutionVariables.PIPELINE_NAME,
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[...]
)
```

If you don't want an experiment and trial created for the pipeline, set `pipeline_experiment_config` to `None`.

### Note

Experiments integration was introduced in the Amazon SageMaker Python SDK v2.41.0.

The following naming rules apply based on what you specify for the `ExperimentName` and `TrialName` parameters of `pipeline_experiment_config`:

- If you don't specify `ExperimentName`, the pipeline name is used for the experiment name.

If you do specify `ExperimentName`, it's used for the experiment name. If an experiment with that name exists, the pipeline-created trials are added to the existing experiment. If an experiment with that name doesn't exist, a new experiment is created.

- If you don't specify `TrialName`, the pipeline execution ID is used for the trial name.

If you do specify `TrialName`, it's used for the trial name. If a trial with that name exists, the pipeline-created trial components are added to the existing trial. If a trial with that name doesn't exist, a new trial is created.

#### Note

The experiment entities aren't deleted when the pipeline that created the entities is deleted. You can use the SageMaker Experiments API to delete the entities. For more information, see [Clean Up Amazon SageMaker Experiment Resources \(p. 1572\)](#).

For information about how to view the SageMaker Experiment entities associated with a pipeline, see [View Experiment Entities Created by SageMaker Pipelines \(p. 2224\)](#). For more information on SageMaker Experiments, see [Manage Machine Learning with Amazon SageMaker Experiments \(p. 1553\)](#).

The following sections show examples of the previous rules and how they are represented in the pipeline definition file. For more information on pipeline definition files, see [SageMaker Pipelines Overview \(p. 2179\)](#).

#### Topics

- [Default Behavior \(p. 2196\)](#)
- [Disable Experiments Integration \(p. 2197\)](#)
- [Specify a Custom Experiment Name \(p. 2197\)](#)
- [Specify a Custom Trial Name \(p. 2198\)](#)

## Default Behavior

### Create a pipeline

The `pipeline_experiment_config` is omitted. `ExperimentName` defaults to the pipeline name. `TrialName` defaults to the execution ID.

```
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    steps=[step_train]
)
```

### Pipeline definition file

```
{
  "Version": "2020-12-01",
  "Parameters": [
    {
      "Name": "InputDataSource"
    },

```

```
{
    "Name": "InstanceCount",
    "Type": "Integer",
    "DefaultValue": 1
}
],
"PipelineExperimentConfig": {
    "ExperimentName": {"Get": "Execution.PipelineName"},
    "TrialName": {"Get": "Execution.PipelineExecutionId"}
},
"Steps": [...]
}
```

## Disable Experiments Integration

### Create a pipeline

The `pipeline_experiment_config` is set to `None`.

```
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=None,
    steps=[step_train]
)
```

### Pipeline definition file

This is the same as the preceding default example, without the `PipelineExperimentConfig`.

## Specify a Custom Experiment Name

A custom experiment name is used. The trial name is set to the execution ID, as with the default behavior.

### Create a pipeline

```
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        "CustomExperimentName",
        ExecutionVariables.PIPELINE_EXECUTION_ID
    ),
    steps=[step_train]
)
```

### Pipeline definition file

```
{
    ...,
    "PipelineExperimentConfig": {
        "ExperimentName": "CustomExperimentName",
        "TrialName": {"Get": "Execution.PipelineExecutionId"}
    },
    "Steps": [...]
}
```

## Specify a Custom Trial Name

A custom trial name is used and appended with the execution ID. The experiment name is set to the pipeline name, as with the default behavior.

### Create a pipeline

```
pipeline_name = f"MyPipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[...],
    pipeline_experiment_config=PipelineExperimentConfig(
        ExecutionVariables.PIPELINE_NAME,
        Join(on="-", values=["CustomTrialName", ExecutionVariables.PIPELINE_EXECUTION_ID])
    ),
    steps=[step_train]
)
```

### Pipeline definition file

```
{
  ...
  "PipelineExperimentConfig": {
    "ExperimentName": {"Get": "Execution.PipelineName"},
    "TrialName": {
      "On": "-",
      "Values": [
        "CustomTrialName",
        {"Get": "Execution.PipelineExecutionId"}
      ]
    }
  },
  "Steps": [...]
}
```

## SageMaker Pipelines Quotas

The following tables list the quotas for SageMaker Pipelines resources and requirements for pipeline creation.

### Pipeline Quotas

<b>Pipeline Property</b>	<b>Quota</b>
Maximum number of pipelines	5000

### Executions Quotas

<b>Execution Property</b>	<b>Quota</b>
Maximum execution time	28 days
Maximum number of concurrent pipeline executions per account	200
Maximum number of concurrent pipeline executions per pipeline	200

## Step Quotas

<b>Step Property</b>	<b>Quota</b>
Maximum number of steps per pipeline	50
Maximum step name length	64 characters
Step name regular expression pattern	([A-Za-z0-9\\-_-])*

## Parameters Quotas

<b>Parameters Property</b>	<b>Quota</b>
Maximum number of parameters per pipeline	200
Maximum parameter name length	64 characters
Maximum parameter name regular expression pattern	([A-Za-z0-9\\-_-])*
Maximum parameter description length	4096 characters
Maximum number of parameter enum values	16 distinct values
Maximum parameter enum value length	2048 characters
Maximum string default value limit	2048 characters

## Condition Step Quotas

<b>Condition Step Property</b>	<b>Quota</b>
Maximum number of Conditions per ConditionStep	200
Maximum number of Steps in If-List	20
Maximum number of Steps in Else-List	20
Maximum number of Conditions in an Or-list	200

## Property Files Quotas

<b>Property Files Property</b>	<b>Quota</b>
Maximum number of PropertyFiles in a pipeline	10
Maximum number of JsonGet functions in a pipeline	200
Maximum size of the property file	2MB

## Metadata Quotas

Metadata Property	Quota
Maximum metadata size	20 key-value pairs
Maximum metadata key size	128 characters
Metadata key regular expression pattern	([A-Za-z0-9\-\_])*
Maximum metadata value size	1024 characters
Metadata value regular expression pattern	[\\p{M}\\p{L}\\p{S}\\p{S}\\p{N}\\p{P}\\s]

## Troubleshooting Amazon SageMaker Model Building Pipelines

When using Amazon SageMaker Model Building Pipelines, you might run into issues for various reasons. This topic provides information about common errors and how to resolve them.

### Pipeline Definition Issues

Your pipeline definition might not be formatted correctly. This can result in your execution failing or your job being inaccurate. These errors can be caught when the pipeline is created or when an execution occurs. If your definition doesn't validate, SageMaker Pipelines returns an error message identifying the character where the JSON file is malformed. To fix this problem, review the steps created using the SageMaker Python SDK for accuracy.

You can only include steps in a pipeline definition once. Because of this, steps cannot exist as part of a Condition step *and* a pipeline in the same pipeline.

### Examining Pipeline Logs

You can view the status of your steps using the following command:

```
execution.list_steps()
```

Each step includes the following information:

- The ARN of the entity launched by the pipeline – Such as SageMaker job ARN, model ARN, or model package ARN.
- The failure reason – Includes a brief explanation of the step failure.
- Condition step evaluation – If the step is a condition step, it includes whether the condition is evaluated to true or false.
- The CacheHit – If the execution is reusing a previous job execution, it lists the source execution.

You can also view the error messages and logs in the SageMaker Studio interface. For information about how to see the logs in Studio, see [View a Pipeline Execution \(p. 2221\)](#).

### Missing Permissions

Correct permissions are required for the role that creates the pipeline execution, and the steps that create each of the jobs in your pipeline execution. Without these permissions, you may not be able to submit your pipeline execution or run your SageMaker jobs as expected. To ensure that your permissions are properly set up, see [Access Management \(p. 2181\)](#).

### Job Execution Errors

You may run into issues when executing your steps because of issues in the scripts that define the functionality of your SageMaker jobs. Each job has a set of CloudWatch logs. To view these logs from SageMaker Studio, see [View a Pipeline Execution \(p. 2221\)](#). For information about using CloudWatch logs with SageMaker, see [Log Amazon SageMaker Events with Amazon CloudWatch \(p. 2534\)](#).

### Property File Errors

You may have issues when incorrectly implementing property files with your pipeline. To ensure that your implementation of property files works as expected, see [Property Files and `JsonGet` \(p. 2191\)](#).

## Create and Manage SageMaker Pipelines

You can use Amazon SageMaker Model Building Pipelines to create end-to-end workflows that manage and deploy SageMaker jobs. SageMaker Pipelines comes with SageMaker Python SDK integration, so you can build each step of your pipeline using a Python-based interface.

After your pipeline is deployed, you can view the directed acyclic graph (DAG) for your pipeline and manage your executions using Amazon SageMaker Studio. Using SageMaker Studio, you can get information about your current and historical pipelines, compare executions, see the DAG for your executions, get metadata information, and more. To learn how to view pipelines from SageMaker Studio, see [View, Track, and Execute SageMaker Pipelines in SageMaker Studio \(p. 2217\)](#).

### Topics

- [Define a Pipeline \(p. 2201\)](#)
- [Run a pipeline \(p. 2214\)](#)
- [View, Track, and Execute SageMaker Pipelines in SageMaker Studio \(p. 2217\)](#)

## Define a Pipeline

To orchestrate your workflows with Amazon SageMaker Model Building Pipelines, you need to generate a directed acyclic graph (DAG) in the form of a JSON pipeline definition. The following image is a representation of the pipeline DAG that you create in this tutorial:

You can generate your JSON pipeline definition using the SageMaker Python SDK. The following tutorial shows how to generate a pipeline definition for a pipeline that solves a regression problem to determine the age of an abalone based on its physical measurements. For a Jupyter notebook that includes the content in this tutorial that you can run, see [Orchestrating Jobs with Amazon SageMaker Model Building Pipelines](#).

#### Topics

- [Prerequisites \(p. 2203\)](#)
- [Create a Pipeline \(p. 2203\)](#)

## Prerequisites

To run the following tutorial you must do the following:

- Set up your notebook instance as outlined in [Create a notebook instance](#). This gives your role permissions to read and write to Amazon S3, and create training, batch transform, and processing jobs in SageMaker.
- Grant your notebook permissions to get and pass its own role as shown in [Modifying a role permissions policy](#). Add the following JSON snippet to attach this policy to your role. Replace <your-role-arn> with the ARN used to create your notebook instance.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "iam:GetRole",  
                "iam:PassRole"  
            ],  
            "Resource": "<your-role-arn>"  
        }  
    ]  
}
```

- Trust the SageMaker service principal by following the steps in [Modifying a role trust policy](#). Add the following statement fragment to the trust relationship of your role:

```
{  
    "Sid": "",  
    "Effect": "Allow",  
    "Principal": {  
        "Service": "sagemaker.amazonaws.com"  
    },  
    "Action": "sts:AssumeRole"  
}
```

## Set Up Your Environment

Create a new SageMaker session using the following code block. This returns the role ARN for the session. This role ARN should be the execution role ARN that you set up as a prerequisite.

```
import boto3  
import sagemaker  
import sagemaker.session  
  
region = boto3.Session().region_name  
sagemaker_session = sagemaker.session.Session()  
role = sagemaker.get_execution_role()  
default_bucket = sagemaker_session.default_bucket()  
model_package_group_name = f"AbaloneModelPackageGroupName"
```

## Create a Pipeline

Run the following steps from your SageMaker notebook instance to create a pipeline including steps for preprocessing, training, evaluation, conditional evaluation, and model registration.

## Step 1: Download the Dataset

This notebook uses the UCI Machine Learning Abalone Dataset. The dataset contains the following features:

- `length` – The longest shell measurement of the abalone.
- `diameter` – The diameter of the abalone perpendicular to its length.
- `height` – The height of the abalone with meat in the shell.
- `whole_weight` – The weight of the whole abalone.
- `shucked_weight` – The weight of the meat removed from the abalone.
- `viscera_weight` – The weight of the abalone viscera after bleeding.
- `shell_weight` – The weight of the abalone shell after meat removal and drying.
- `sex` – The sex of the abalone. One of 'M', 'F', or 'I', where 'I' is an infant abalone.
- `rings` – The number of rings in the abalone shell.

The number of rings in the abalone shell is a good approximation for its age using the formula `age=rings + 1.5`. However, obtaining this number is a time-consuming task. You must cut the shell through the cone, stain the section, and count the number of rings through a microscope. However, the other physical measurements are easier to determine. This notebook uses the dataset to build a predictive model of the variable `rings` using the other physical measurements.

### To download the dataset

1. Download the dataset into your account's default Amazon S3 bucket.

```
!mkdir -p data
local_path = "data/abalone-dataset.csv"

s3 = boto3.resource("s3")
s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file(
    "dataset/abalone-dataset.csv",
    local_path
)

base_uri = f"s3://{default_bucket}/abalone"
input_data_uri = sagemaker.s3.S3Uploader.upload(
    local_path=local_path,
    desired_s3_uri=base_uri,
)
print(input_data_uri)
```

2. Download a second dataset for batch transformation after your model is created.

```
local_path = "data/abalone-dataset-batch"

s3 = boto3.resource("s3")
s3.Bucket(f"sagemaker-servicecatalog-seedcode-{region}").download_file(
    "dataset/abalone-dataset-batch",
    local_path
)

base_uri = f"s3://{default_bucket}/abalone"
batch_data_uri = sagemaker.s3.S3Uploader.upload(
    local_path=local_path,
    desired_s3_uri=base_uri,
)
print(batch_data_uri)
```

## Step 2: Define Pipeline Parameters

This code block defines the following parameters for your pipeline:

- `processing_instance_type` – The `ml.*` instance type of the processing jobs.
- `processing_instance_count` – The instance count of the processing job.
- `training_instance_type` – The `ml.*` instance type of the training jobs.
- `input_data` – The Amazon S3 location of the input data.
- `batch_data` – The Amazon S3 location of the input data for batch transformation.
- `model_approval_status` – The approval status to register the trained model with for CI/CD. For more information, see [Automate MLOps with SageMaker Projects \(p. 2232\)](#).

```
from sagemaker.workflow.parameters import (
    ParameterInteger,
    ParameterString,
)

processing_instance_count = ParameterInteger(
    name="ProcessingInstanceCount",
    default_value=1
)
processing_instance_type = ParameterString(
    name="ProcessingInstanceType",
    default_value="ml.m5.xlarge"
)
training_instance_type = ParameterString(
    name="TrainingInstanceType",
    default_value="ml.m5.xlarge"
)
model_approval_status = ParameterString(
    name="ModelApprovalStatus",
    default_value="PendingManualApproval"
)
input_data = ParameterString(
    name="InputData",
    default_value=input_data_uri,
)
batch_data = ParameterString(
    name="BatchData",
    default_value=batch_data_uri,
)
```

## Step 3: Define a Processing Step for Feature Engineering

This section shows how to create a processing step to prepare the data from the dataset for training.

### To create a processing step

1. Create a directory for the processing script.

```
!mkdir -p abalone
```

2. Create a file in the `/abalone` directory named `preprocessing.py` with the following content. This preprocessing script is passed in to the processing step for execution on the input data. The training step then uses the preprocessed training features and labels to train a model, and the evaluation step uses the trained model and preprocessed test features and labels to evaluate the model. The script uses `scikit-learn` to do the following:

- Fill in missing `sex` categorical data and encode it so it's suitable for training.
- Scale and normalize all numerical fields except for `rings` and `sex`.
- Split the data into training, test, and validation datasets.

```
%>%%writefile abalone/preprocessing.py
import argparse
import os
import requests
import tempfile
import numpy as np
import pandas as pd

from sklearn.compose import ColumnTransformer
from sklearn.impute import SimpleImputer
from sklearn.pipeline import Pipeline
from sklearn.preprocessing import StandardScaler, OneHotEncoder

# Because this is a headerless CSV file, specify the column names here.
feature_columns_names = [
    "sex",
    "length",
    "diameter",
    "height",
    "whole_weight",
    "shucked_weight",
    "viscera_weight",
    "shell_weight",
]
label_column = "rings"

feature_columns_dtype = {
    "sex": str,
    "length": np.float64,
    "diameter": np.float64,
    "height": np.float64,
    "whole_weight": np.float64,
    "shucked_weight": np.float64,
    "viscera_weight": np.float64,
    "shell_weight": np.float64
}
label_column_dtype = {"rings": np.float64}

def merge_two_dicts(x, y):
    z = x.copy()
    z.update(y)
    return z

if __name__ == "__main__":
    base_dir = "/opt/ml/processing"

    df = pd.read_csv(
        f"{base_dir}/input/abalone-dataset.csv",
        header=None,
        names=feature_columns_names + [label_column],
        dtype=merge_two_dicts(feature_columns_dtype, label_column_dtype)
    )
    numeric_features = list(feature_columns_names)
    numeric_features.remove("sex")
```

```

        numeric_transformer = Pipeline(
            steps=[
                ("imputer", SimpleImputer(strategy="median")),
                ("scaler", StandardScaler())
            ]
        )

        categorical_features = ["sex"]
        categorical_transformer = Pipeline(
            steps=[
                ("imputer", SimpleImputer(strategy="constant", fill_value="missing")),
                ("onehot", OneHotEncoder(handle_unknown="ignore"))
            ]
        )

        preprocess = ColumnTransformer(
            transformers=[
                ("num", numeric_transformer, numeric_features),
                ("cat", categorical_transformer, categorical_features)
            ]
        )

        y = df.pop("rings")
        X_pre = preprocess.fit_transform(df)
        y_pre = y.to_numpy().reshape(len(y), 1)

        X = np.concatenate((y_pre, X_pre), axis=1)

        np.random.shuffle(X)
        train, validation, test = np.split(X, [int(.7*len(X)), int(.85*len(X))])

        pd.DataFrame(train).to_csv(f"{base_dir}/train/train.csv", header=False,
        index=False)
        pd.DataFrame(validation).to_csv(f"{base_dir}/validation/validation.csv",
        header=False, index=False)
        pd.DataFrame(test).to_csv(f"{base_dir}/test/test.csv", header=False, index=False)
    
```

3. Create an instance of an `SKLearnProcessor` to pass in to the processing step.

```

from sagemaker.sklearn.processing import SKLearnProcessor

framework_version = "0.23-1"

sklearn_processor = SKLearnProcessor(
    framework_version=framework_version,
    instance_type=processing_instance_type,
    instance_count=processing_instance_count,
    base_job_name="sklearn-abalone-process",
    role=role,
)
    
```

4. Create a processing step. This step takes in the `SKLearnProcessor`, the input and output channels, and the `preprocessing.py` script that you created. This is very similar to a processor instance's `run` method in the SageMaker Python SDK. The `input_data` parameter passed into `ProcessingStep` is the input data of the step itself. This input data is used by the processor instance when it runs.

Note the "train," "validation," and "test" named channels specified in the output configuration for the processing job. Step Properties such as these can be used in subsequent steps and resolve to their runtime values at execution.

```
from sagemaker.processing import ProcessingInput, ProcessingOutput
from sagemaker.workflow.steps import ProcessingStep

step_process = ProcessingStep(
    name="AbaloneProcess",
    processor=sklearn_processor,
    inputs=[
        ProcessingInput(source=input_data, destination="/opt/ml/processing/input"),
    ],
    outputs=[
        ProcessingOutput(output_name="train", source="/opt/ml/processing/train"),
        ProcessingOutput(output_name="validation", source="/opt/ml/processing/validation"),
        ProcessingOutput(output_name="test", source="/opt/ml/processing/test")
    ],
    code="abalone/preprocessing.py",
)
```

#### Step 4: Define a Training step

This section shows how to use the SageMaker [XGBoost Algorithm](#) to train a logistic regression model on the training data output from the processing steps.

#### To define a training step

1. Specify the model path where you want to save the models from training.

```
model_path = f"s3://{default_bucket}/AbaloneTrain"
```

2. Configure an estimator for the XGBoost algorithm and the input dataset. The `training_instance_type` is passed into the estimator. A typical training script loads data from the input channels, configures training with hyperparameters, trains a model, and saves a model to `model_dir` so that it can be hosted later. SageMaker uploads the model to Amazon S3 in the form of a `model.tar.gz` at the end of the training job.

```
from sagemaker.estimator import Estimator

image_uri = sagemaker.image_uris.retrieve(
    framework="xgboost",
    region=region,
    version="1.0-1",
    py_version="py3",
    instance_type=training_instance_type,
)
xgb_train = Estimator(
    image_uri=image_uri,
    instance_type=training_instance_type,
    instance_count=1,
    output_path=model_path,
    role=role,
)
xgb_train.set_hyperparameters(
    objective="reg:linear",
    num_round=50,
    max_depth=5,
    eta=0.2,
    gamma=4,
    min_child_weight=6,
```

```

        subsample=0.7,
        silent=0
    )

```

3. Create a `TrainingStep` using the estimator instance and properties of the `ProcessingStep`. In particular, pass in the `S3Uri` of the "train" and "validation" output channel to the `TrainingStep`.

```

from sagemaker.inputs import TrainingInput
from sagemaker.workflow.steps import TrainingStep

step_train = TrainingStep(
    name="AbaloneTrain",
    estimator=xgb_train,
    inputs={
        "train": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs[
                "train"
            ].S3Output.S3Uri,
            content_type="text/csv"
        ),
        "validation": TrainingInput(
            s3_data=step_process.properties.ProcessingOutputConfig.Outputs[
                "validation"
            ].S3Output.S3Uri,
            content_type="text/csv"
        )
    }
)

```

## Step 5: Define a Processing Step for Model Evaluation

This section shows how to create a processing step to evaluate the accuracy of the model. The result of this model evaluation is used in the condition step to determine which execute path to take.

### To define a processing step for model evaluation

1. Create a file in the `/abalone` directory named `evaluation.py`. This script is used in a processing step to perform model evaluation. It takes a trained model and the test dataset as input, then produces a JSON file containing classification evaluation metrics. These metrics include a precision, recall, and F1 score for each label, and accuracy and ROC curve for the model.

```

%%writefile abalone/evaluation.py
import json
import pathlib
import pickle
import tarfile
import joblib
import numpy as np
import pandas as pd
import xgboost

from sklearn.metrics import mean_squared_error

if __name__ == "__main__":
    model_path = f"/opt/ml/processing/model/model.tar.gz"
    with tarfile.open(model_path) as tar:
        tar.extractall(path=".")

```

```

model = pickle.load(open("xgboost-model", "rb"))

test_path = "/opt/ml/processing/test/test.csv"
df = pd.read_csv(test_path, header=None)

y_test = df.iloc[:, 0].to_numpy()
df.drop(df.columns[0], axis=1, inplace=True)

X_test = xgboost.DMatrix(df.values)

predictions = model.predict(X_test)

mse = mean_squared_error(y_test, predictions)
std = np.std(y_test - predictions)
report_dict = {
    "regression_metrics": {
        "mse": {
            "value": mse,
            "standard_deviation": std
        },
    },
}

output_dir = "/opt/ml/processing/evaluation"
pathlib.Path(output_dir).mkdir(parents=True, exist_ok=True)

evaluation_path = f"{output_dir}/evaluation.json"
with open(evaluation_path, "w") as f:
    f.write(json.dumps(report_dict))

```

2. Create an instance of a `ScriptProcessor` that is used to create a `ProcessingStep`.

```

from sagemaker.processing import ScriptProcessor

script_eval = ScriptProcessor(
    image_uri=image_uri,
    command=["python3"],
    instance_type=processing_instance_type,
    instance_count=1,
    base_job_name="script-abalone-eval",
    role=role,
)

```

3. Create a `ProcessingStep` using the processor instance, the input and output channels, and the `evaluation.py` script. In particular, pass in the `S3ModelArtifacts` property from the `step_train` training step, as well as the `S3Uri` of the "test" output channel of the `step_process` processing step. This is very similar to a processor instance's `run` method in the SageMaker Python SDK.

```

from sagemaker.workflow.properties import PropertyFile

evaluation_report = PropertyFile(
    name="EvaluationReport",
    output_name="evaluation",
    path="evaluation.json"
)
step_eval = ProcessingStep(
    name="AbaloneEval",
    processor=script_eval,
    inputs=[
        ProcessingInput(
            source=step_train.properties.ModelArtifacts.S3ModelArtifacts,

```

```

        destination="/opt/ml/processing/model"
    ),
    ProcessingInput(
        source=step_process.properties.ProcessingOutputConfig.Outputs[
            "test"
        ].S3Output.S3Uri,
        destination="/opt/ml/processing/test"
    )
],
outputs=[
    ProcessingOutput(output_name="evaluation", source="/opt/ml/processing/
evaluation"),
],
code="abalone/evaluation.py",
property_files=[evaluation_report],
)
)

```

## Step 6: Define a CreateModelStep for Batch Transformation

This section shows how to create a SageMaker model from the output of the training step. This model is used for batch transformation on a new dataset. This step is passed into the condition step and only executes if the condition step evaluates to true.

### To define a CreateModelStep for batch transformation

1. Create a SageMaker model. Pass in the `S3ModelArtifacts` property from the `step_train` training step.

```

from sagemaker.model import Model

model = Model(
    image_uri=image_uri,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    sagemaker_session=sagemaker_session,
    role=role,
)

```

2. Define the model input for your SageMaker model.

```

from sagemaker.inputs import CreateModelInput

inputs = CreateModelInput(
    instance_type="ml.m5.large",
    accelerator_type="ml.eia1.medium",
)

```

3. Create your `CreateModelStep` using the `CreateModelInput` and SageMaker model instance you defined.

```

from sagemaker.workflow.steps import CreateModelStep

step_create_model = CreateModelStep(
    name="AbaloneCreateModel",
    model=model,
    inputs=inputs,
)

```

## Step 7: Define a TransformStep to Perform Batch Transformation

This section shows how to create a `TransformStep` to perform batch transformation on a dataset after the model is trained. This step is passed into the condition step and only executes if the condition step evaluates to true.

### To define a `TransformStep` to perform batch transformation

1. Create a transformer instance with the appropriate compute instance type, instance count, and desired output Amazon S3 bucket URI. Pass in the `ModelName` property from the `step_create_model` `CreateModel` step.

```
from sagemaker.transformer import Transformer

transformer = Transformer(
    model_name=step_create_model.properties.ModelName,
    instance_type="ml.m5.xlarge",
    instance_count=1,
    output_path=f"s3://{default_bucket}/AbaloneTransform"
)
```

2. Create a `TransformStep` using the transformer instance you defined and the `batch_data` pipeline parameter.

```
from sagemaker.inputs import TransformInput
from sagemaker.workflow.steps import TransformStep

step_transform = TransformStep(
    name="AbaloneTransform",
    transformer=transformer,
    inputs=TransformInput(data=batch_data)
)
```

## Step 8: Define a RegisterModel Step to Create a Model Package

This section shows how to construct an instance of `RegisterModel`. The result of executing `RegisterModel` in a pipeline is a model package. A model package is a reusable model artifacts abstraction that packages all ingredients necessary for inference. It consists of an inference specification that defines the inference image to use along with an optional model weights location. A model package group is a collection of model packages. You can use a `ModelPackageGroup` for SageMaker Pipelines to add a new version and model package to the group for every pipeline execution. For more information about model registry, see [Register and Deploy Models with Model Registry \(p. 2003\)](#).

This step is passed into the condition step and only executes if the condition step evaluates to true.

### To define a `RegisterModel` step to create a model package

- Construct a `RegisterModel` step using the estimator instance you used for the training step . Pass in the `S3ModelArtifacts` property from the `step_train` training step and specify a `ModelPackageGroup`. SageMaker Pipelines creates this `ModelPackageGroup` for you.

```
from sagemaker.model_metrics import MetricsSource, ModelMetrics
from sagemaker.workflow.step_collections import RegisterModel

model_metrics = ModelMetrics(
    model_statistics=MetricsSource(
```

```

        s3_uri="{}/evaluation.json".format(
            step_eval.arguments["ProcessingOutputConfig"]["Outputs"][0]["S3Output"]
        ["S3Uri"]
        ),
        content_type="application/json"
    )
)
step_register = RegisterModel(
    name="AbaloneRegisterModel",
    estimator=xgb_train,
    model_data=step_train.properties.ModelArtifacts.S3ModelArtifacts,
    content_types=["text/csv"],
    response_types=["text/csv"],
    inference_instances=["ml.t2.medium", "ml.m5.xlarge"],
    transform_instances=["ml.m5.xlarge"],
    model_package_group_name=model_package_group_name,
    approval_status=model_approval_status,
    model_metrics=model_metrics
)

```

## Step 9: Define a Condition Step to Verify Model Accuracy

A ConditionStep allows SageMaker Pipelines to support conditional execution in your pipeline DAG based on the condition of step properties. In this case, you only want to register a model package if the accuracy of that model, as determined by the model evaluation step, exceeds the required value. If the accuracy exceeds the required value, the pipeline also creates a SageMaker Model and runs batch transformation on a dataset. This section shows how to define the Condition step.

### To define a condition step to verify model accuracy

1. Define a ConditionLessThanOrEqualTo condition using the accuracy value found in the output of the model evaluation processing step, step\_eval. Get this output using the property file you indexed in the processing step and the respective JSONPath of the mean squared error value, "mse".

```

from sagemaker.workflow.conditions import ConditionLessThanOrEqualTo
from sagemaker.workflow.condition_step import (
    ConditionStep,
    JsonGet,
)

cond_lte = ConditionLessThanOrEqualTo(
    left=JsonGet(
        step=step_eval,
        property_file=evaluation_report,
        json_path="regression_metrics.mse.value"
    ),
    right=6.0
)

```

2. Construct a ConditionStep. Pass the ConditionEquals condition in, then set the model package registration and batch transformation steps as the next steps if the condition passes.

```

step_cond = ConditionStep(
    name="AbaloneMSECond",
    conditions=[cond_lte],
    if_steps=[step_register, step_create_model, step_transform],
    else_steps=[],
)

```

## Step 10: Create a pipeline

Now that you've created all of the steps, combine them into a pipeline.

### To create a pipeline

1. Define the following for your pipeline: `name`, `parameters`, and `steps`. Names must be unique within an `(account, region)` pair.

**Note**

A step can only appear once in either the pipeline's step list or the if/else step lists of the condition step. It cannot appear in both.

```
from sagemaker.workflow.pipeline import Pipeline

pipeline_name = f"AbalonePipeline"
pipeline = Pipeline(
    name=pipeline_name,
    parameters=[
        processing_instance_type,
        processing_instance_count,
        training_instance_type,
        model_approval_status,
        input_data,
        batch_data,
    ],
    steps=[step_process, step_train, step_eval, step_cond],
)
```

2. (Optional) Examine the JSON pipeline definition to ensure that it's well-formed.

```
import json

json.loads(pipeline.definition())
```

This pipeline definition is ready to submit to SageMaker. In the next tutorial, you submit this pipeline to SageMaker and start an execution.

**Next step:** [Run a pipeline \(p. 2214\)](#)

## Run a pipeline

After you've created a pipeline definition using the SageMaker Python SDK, you can submit it to SageMaker to start your execution. The following tutorial shows how to submit a pipeline, start an execution, examine the results of that execution, and delete your pipeline.

### Topics

- [Prerequisites \(p. 2214\)](#)
- [Step 1: Start the Pipeline \(p. 2215\)](#)
- [Step 2: Examine a Pipeline Execution \(p. 2215\)](#)
- [Step 3: Override Default Parameters for a Pipeline Execution \(p. 2216\)](#)
- [Step 4: Stop and Delete a Pipeline Execution \(p. 2217\)](#)

## Prerequisites

This tutorial requires the following:

- A SageMaker notebook instance.
- A SageMaker Pipelines pipeline definition. This tutorial assumes you're using the pipeline definition created by completing the [Define a Pipeline \(p. 2201\)](#) tutorial.

## Step 1: Start the Pipeline

First, you need to start the pipeline.

### To start the pipeline

1. Examine the JSON pipeline definition to ensure that it's well-formed.

```
import json
json.loads(pipeline.definition())
```

2. Submit the pipeline definition to the SageMaker Pipelines service to create a pipeline if it doesn't exist, or update the pipeline if it does. The role passed in is used by SageMaker Pipelines to create all of the jobs defined in the steps.

```
pipeline.upsert(role_arn=role)
```

3. Start a pipeline execution.

```
execution = pipeline.start()
```

## Step 2: Examine a Pipeline Execution

Next, you need to examine the pipeline execution.

### To examine a pipeline execution

1. Describe the pipeline execution status to ensure that it has been created and started successfully.

```
execution.describe()
```

2. Wait for the execution to finish.

```
execution.wait()
```

3. List the execution steps and their status.

```
execution.list_steps()
```

Your output should look like the following:

```
[{'StepName': 'AbaloneTransform',
  'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 870000, tzinfo=tzlocal()),
  'EndTime': datetime.datetime(2020, 11, 21, 2, 45, 50, 492000, tzinfo=tzlocal()),
  'StepStatus': 'Succeeded',
  'CacheHitResult': {'SourcePipelineExecutionArn': ''},
  'Metadata': {'TransformJob': {'Arn': 'arn:aws:sagemaker:us-
east-2:111122223333:transform-job/pipelines-cfvyltjuxdq8-abalonetransform-
ptyjoef3jy'}},
  {'StepName': 'AbaloneRegisterModel',
  'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 929000, tzinfo=tzlocal()),
```

```

'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 28, 15000, tzinfo=tzlocal()),
'StepStatus': 'Succeeded',
'CacheHitResult': {'SourcePipelineExecutionArn': ''},
'Metadata': {'RegisterModel': {'Arn': 'arn:aws:sagemaker:us-
east-2:111122223333:model-package/abalonemodelpackagegroupname/1'}},
{'StepName': 'AbaloneCreateModel',
 'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 895000, tzinfo=tzlocal()),
 'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 27, 708000, tzinfo=tzlocal()),
 'StepStatus': 'Succeeded',
 'CacheHitResult': {'SourcePipelineExecutionArn': ''},
 'Metadata': {'Model': {'Arn': 'arn:aws:sagemaker:us-east-2:111122223333:model/
pipelines-cfvyltjuxdq8-abalonecreatemodel-jl94rai0ra'}},
{'StepName': 'AbaloneMSECond',
 'StartTime': datetime.datetime(2020, 11, 21, 2, 41, 25, 558000, tzinfo=tzlocal()),
 'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 26, 329000, tzinfo=tzlocal()),
 'StepStatus': 'Succeeded',
 'CacheHitResult': {'SourcePipelineExecutionArn': ''},
 'Metadata': {'Condition': {'Outcome': 'True'}},
{'StepName': 'AbaloneEval',
 'StartTime': datetime.datetime(2020, 11, 21, 2, 37, 34, 767000, tzinfo=tzlocal()),
 'EndTime': datetime.datetime(2020, 11, 21, 2, 41, 18, 80000, tzinfo=tzlocal()),
 'StepStatus': 'Succeeded',
 'CacheHitResult': {'SourcePipelineExecutionArn': ''},
 'Metadata': {'ProcessingJob': {'Arn': 'arn:aws:sagemaker:us-
east-2:111122223333:processing-job/pipelines-cfvyltjuxdq8-abaloneeval-zfrazohmny'}},
{'StepName': 'AbaloneTrain',
 'StartTime': datetime.datetime(2020, 11, 21, 2, 34, 55, 867000, tzinfo=tzlocal()),
 'EndTime': datetime.datetime(2020, 11, 21, 2, 37, 34, 34000, tzinfo=tzlocal()),
 'StepStatus': 'Succeeded',
 'CacheHitResult': {'SourcePipelineExecutionArn': ''},
 'Metadata': {'TrainingJob': {'Arn': 'arn:aws:sagemaker:us-
east-2:111122223333:training-job/pipelines-cfvyltjuxdq8-abalonetrain-tavd6f3wdf'}},
{'StepName': 'AbaloneProcess',
 'StartTime': datetime.datetime(2020, 11, 21, 2, 30, 27, 160000, tzinfo=tzlocal()),
 'EndTime': datetime.datetime(2020, 11, 21, 2, 34, 48, 390000, tzinfo=tzlocal()),
 'StepStatus': 'Succeeded',
 'CacheHitResult': {'SourcePipelineExecutionArn': ''},
 'Metadata': {'ProcessingJob': {'Arn': 'arn:aws:sagemaker:us-
east-2:111122223333:processing-job/pipelines-cfvyltjuxdq8-abaloneprocess-
mgqyfdujcj'}}}]

```

- After your pipeline execution is complete, download the resulting `evaluation.json` file from Amazon S3 to examine the report.

```

evaluation_json = sagemaker.s3.S3Downloader.read_file("{}/evaluation.json".format(
    step_eval.arguments["ProcessingOutputConfig"]["Outputs"][0]["S3Output"]["S3Uri"]
))
json.loads(evaluation_json)

```

## Step 3: Override Default Parameters for a Pipeline Execution

You can run additional executions of the pipeline by specifying different pipeline parameters to override the defaults.

### To override default parameters

- Create the pipeline execution. This starts another pipeline execution on a compute-optimized instance type and sets the model approval status to "Approved". This means that the model package version generated by the `RegisterModel` step is automatically ready for deployment through CI/CD pipelines, such as with SageMaker Projects. For more information, see [Automate MLOps with SageMaker Projects \(p. 2232\)](#).

```
execution = pipeline.start(  
    parameters=dict(  
        ProcessingInstanceType="ml.c5.xlarge",  
        ModelApprovalStatus="Approved",  
    )  
)
```

2. Wait for the execution to finish.

```
execution.wait()
```

3. List the execution steps and their status.

```
execution.list_steps()
```

4. After your pipeline execution is complete, download the resulting `evaluation.json` file from Amazon S3 to examine the report.

```
evaluation_json = sagemaker.s3.S3Downloader.read_file("{}/evaluation.json".format(  
    step_eval.arguments["ProcessingOutputConfig"]["Outputs"][0]["S3Output"]["S3Uri"]  
)  
json.loads(evaluation_json)
```

## Step 4: Stop and Delete a Pipeline Execution

When you're finished with your pipeline, you can stop any ongoing executions and delete the pipeline.

### To stop and delete a pipeline execution

1. Stop the pipeline execution.

```
execution.stop()
```

2. Delete the pipeline.

```
pipeline.delete()
```

## View, Track, and Execute SageMaker Pipelines in SageMaker Studio

To view, track, and execute Amazon SageMaker Pipelines in Amazon SageMaker Studio, you must sign in to Studio. For more information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).

### Topics

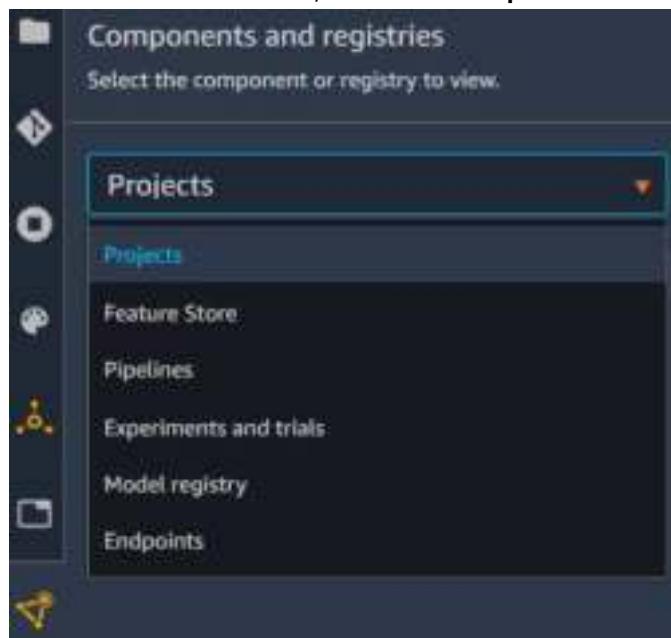

- [View a Pipeline \(p. 2218\)](#)
- [View a Pipeline Execution \(p. 2221\)](#)
- [View Experiment Entities Created by SageMaker Pipelines \(p. 2224\)](#)
- [Execute a Pipeline \(p. 2226\)](#)
- [Track the Lineage of a SageMaker ML Pipeline \(p. 2228\)](#)

## View a Pipeline

This procedure shows you how to directly find a pipeline and view its details page. You can also find pipelines that are part of a project listed in the project's details page. For information on finding a pipeline that is part of a project, see [Automate MLOps with SageMaker Projects \(p. 2232\)](#).

### To view a list of pipelines

1. In the left sidebar of Studio, choose the **Components and registries** icon (💡).

2. Select **Pipelines** from the dropdown list.

Pipelines	
<input type="text"/> Search column name to start	
Name	Last modified
AbalonePipeline	2 days ago
CensusProcessTrainEvalC...	11 days ago
AbaloneProcessTrainEval...	11 days ago
AbaloneProcessTrainEval...	18 days ago

3. Drag the right border of the **Components and registries** pane to the right to view all the columns. Use search to narrow the list of pipelines.

Search is a two-step process. First, you enter characters that match the column name you want to search. Second, you enter characters to match the item in that column.

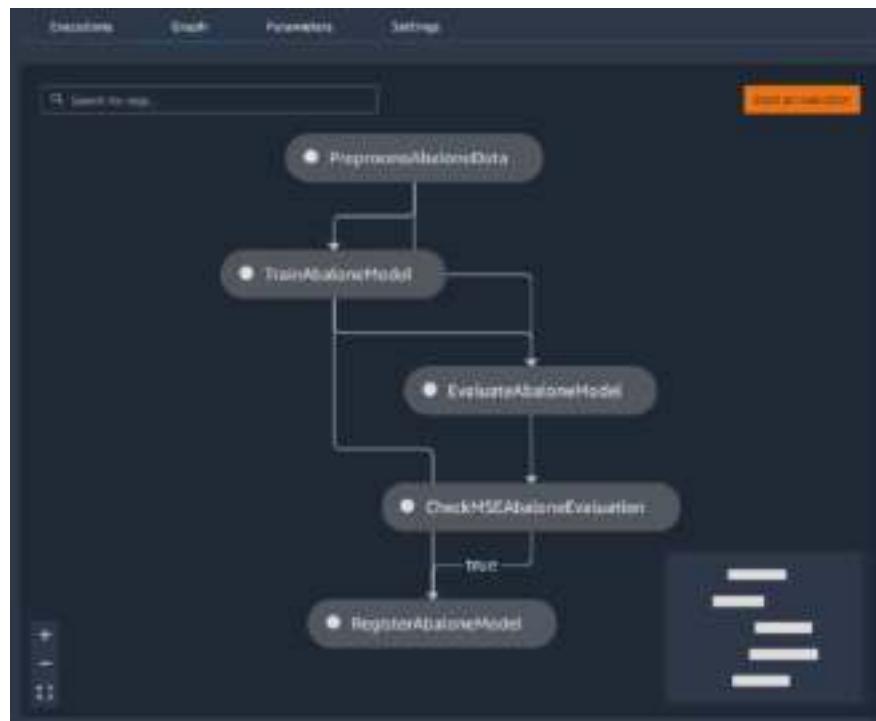

You can have multiple search filters. As an example, the following screenshot limits the displayed pipelines to those with a name that starts with aba and created by Me. For more information on searching in Studio, see [Search Experiments Using Amazon SageMaker Studio \(p. 1567\)](#).

The screenshot shows the 'Components and registries' section of the Amazon SageMaker Studio interface. A search bar at the top says 'Select the component or registry to view.' Below it, a dropdown menu is set to 'Pipelines'. A search bar labeled 'Search column name to start' contains 'Name: aba'. Below the search bar are three buttons: 'Name: aba' with an 'X', 'Created by: Me' with an 'X', and 'Clear all'. A table follows, with columns: Name, Created, Created by, and Last modified. One row is visible: 'AbaloneProcessTrainEval...' was created '7 days ago' by 'kudzu-1' and last modified '7 days ago'. At the bottom of the table, it says 'End of the list'.

4. Open a pipeline to view details about the pipeline. The pipeline details tab opens and displays a list of pipeline executions. You can start an execution or choose one of the other tabs for more information about the pipeline. Use the **Settings** icon ( ) to choose which columns to display.

The screenshot shows the 'AbaloneProcessTrainEvalCondRegister-16050297567595590' pipeline details page. It features tabs for 'Overview', 'Graph', 'Execution', and 'Settings'. The 'Execution' tab is active, showing a table of pipeline executions. The table has columns: Status, Step, Pipeline, Last modified, and Last run. One execution is listed: 'Completed' status, 'Step 1' step, 'AbaloneProcessTrainEval...' pipeline, '7 days ago' last modified, and 'Completed' last run. To the right of the table is a 'TABLE PREFERENCES' sidebar with options like 'Auto-refresh interval', 'Execute group parallel', and a list of columns to include/exclude. An orange 'Start a new exec' button is located to the right of the table.

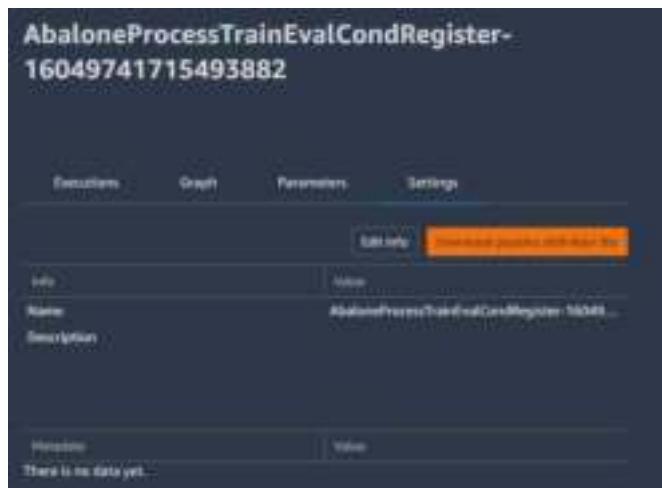

5. From the pipeline details page, choose one of the following tabs to view details about the pipeline:
  - **Executions** – Details about the executions. You can start an execution from this tab or the **Graph** tab.
  - **Graph** – The DAG for the pipeline.

- **Parameters** – Includes the model approval status.

Name	Type	Value
ProcessingInstanceType	String	m4.4xlarge
ProcessingInstanceCount	Integer	1
TrainingInstanceType	String	m4.4xlarge
ModelApprovalStatus	String	PendingManualApproval
InputData	String	<a href="https://s3-us-west-2.amazonaws.com">https://s3-us-west-2.amazonaws.com</a>

- **Settings** – The metadata associated with the pipeline. You can download the pipeline definition file and edit the pipeline name and description from this tab.

## View a Pipeline Execution

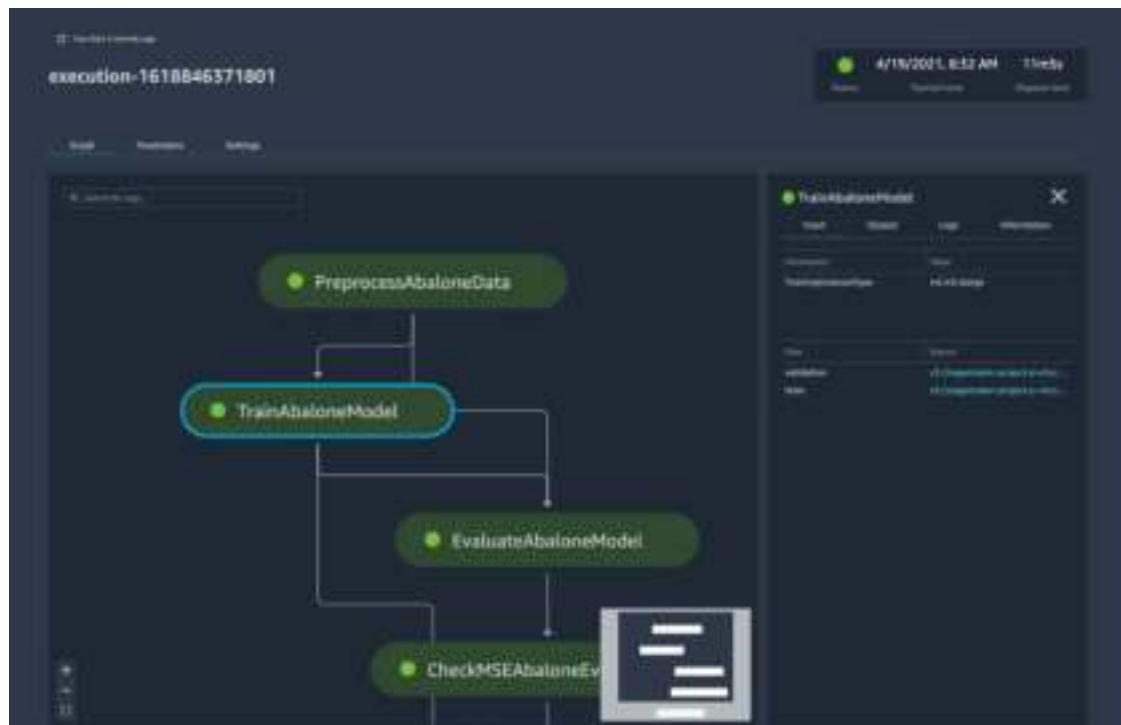

This procedure shows you how to view a pipeline execution. For information on how to view a list of pipeline executions, and how to use SageMaker search to narrow the executions in the list, see [View a Pipeline \(p. 2218\)](#).

### To view details of a pipeline execution

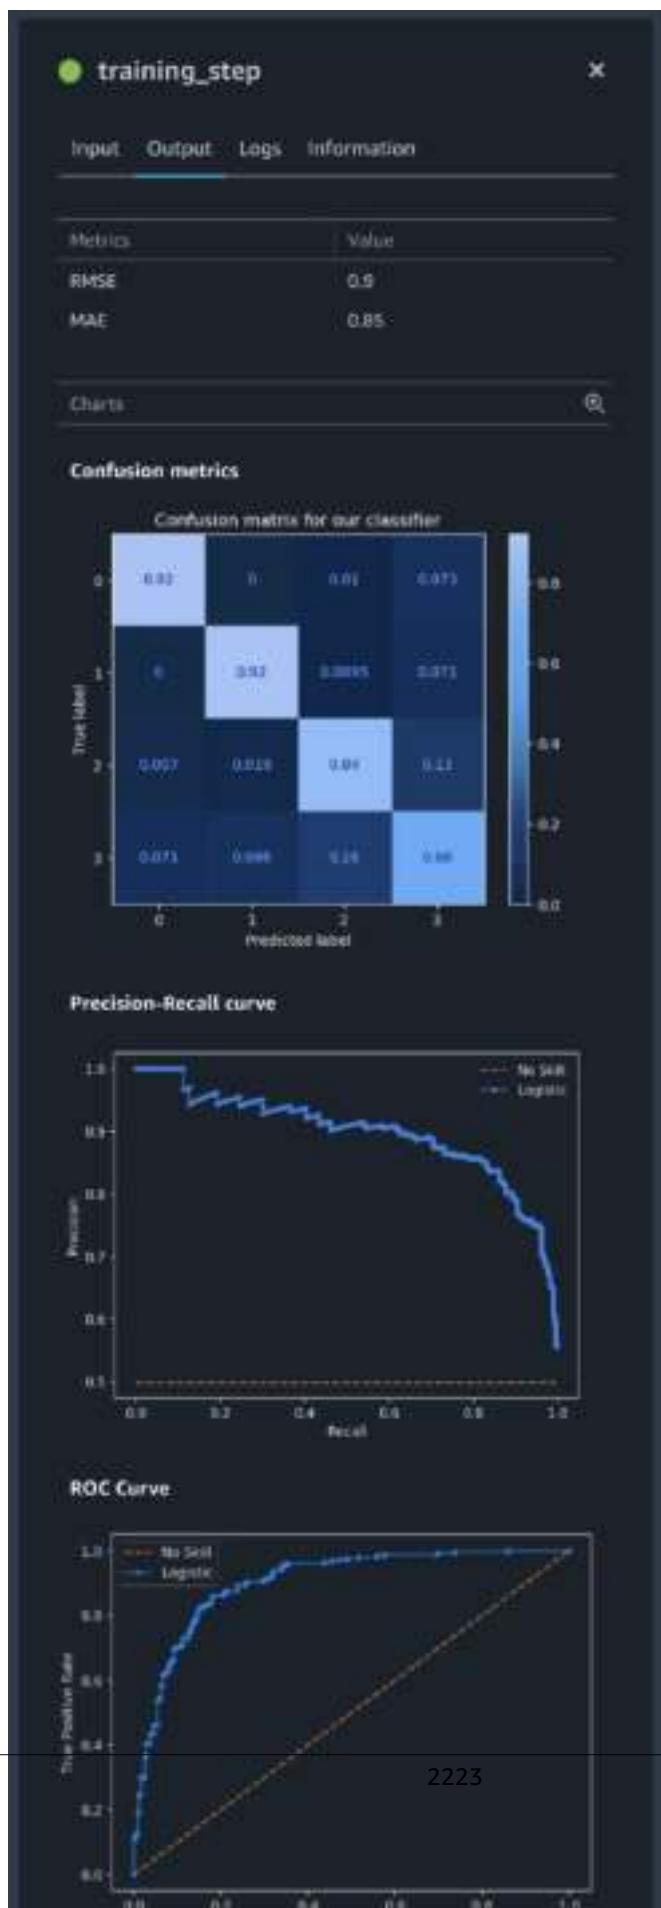

1. In the execution list, open an execution to view details about the execution. The execution details tab opens and displays a graph of the steps in the pipeline. You can choose one of the other tabs to view information about the pipeline execution, which is similar to that shown when viewing the pipeline details.

2. Use search to find a step in the graph. Type characters that match a step name. You can drag the graph around or use the resizing icons on the lower-left side of the graph. The inset on the lower-right side of the graph displays where you are in the graph.

3. Choose one of the steps in the graph to see details about the step. In the preceding screenshot, a training step is chosen and displays the following tabs:
  - **Input** – The training inputs. If an input source is from Amazon Simple Storage Service (Amazon S3), choose the link to view the file in the Amazon S3 console.
  - **Output** – The training outputs, such as metrics, charts, files, and evaluation outcome. The graphs were produced using the [Tracker APIs](#).

- **Logs** – The Amazon CloudWatch logs produced by the step.

Output	Logs	Info
<a href="#">View logs in CloudWatch console</a>

## View Experiment Entities Created by SageMaker Pipelines

When you create a pipeline and specify `pipeline_experiment_config`, SageMaker Pipelines creates the following SageMaker Experiments entities by default if they don't exist:

- An experiment for the pipeline
- A trial for every execution of the pipeline
- A trial component for each SageMaker job created in a pipeline step

For information on how experiments are integrated with pipelines, see [Amazon SageMaker Experiments Integration \(p. 2195\)](#). For more information on SageMaker Experiments, see [Manage Machine Learning with Amazon SageMaker Experiments \(p. 1553\)](#).

You can get to the list of trial components associated with a pipeline from either the pipeline executions list or the experiments list.

#### To view the trial components list from the pipeline executions list

1. To view the pipeline executions list, follow the first four steps in [View a Pipeline \(p. 2218\)](#).
2. On the top right of the screen, choose the **Settings** icon (⚙️) to open **TABLE PROPERTIES**.
3. Select **Experiment**. If experiment integration wasn't disabled when the pipeline was created, the experiment name and trial name are displayed in the executions list.

##### Note

Experiments integration was introduced in v2.41.0 of the [Amazon SageMaker Python SDK](#). Pipelines created with an earlier version of the SDK aren't integrated with experiments by default.

4. Select one or more executions, open (right-click) the selection, then choose **View trial components generated by execution**.

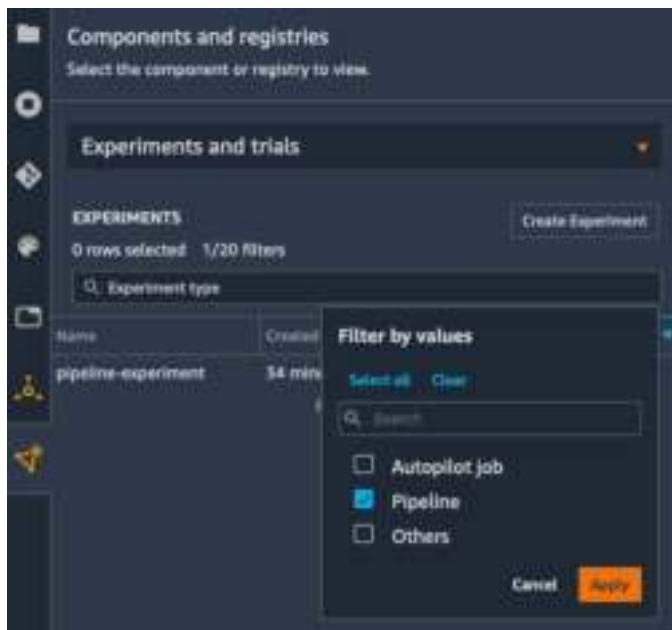

#### To view the trial components list from the experiments list

1. In the left sidebar of Studio, choose the **Components and registries** icon (💡).
2. Select **Experiments and trials** from the dropdown list.
3. Use search to filter the list to experiments created by a pipeline.
  - a. Drag the right border of the **Components and registries** pane to the right until you can see the **Experiment type** column.
  - b. In the search box, enter ex and choose **Experiment type**.
  - c. In **Filter by values**, choose **Pipeline**, then choose **Apply**.

To further narrow the search, you can add additional filters. For more information, see [Search Experiments Using Amazon SageMaker Studio \(p. 1567\)](#).

4. Open (right-click) an experiment name and choose **Open in trial component list**.

### List of trial components

The following shows the list of trial components created by the pipeline.

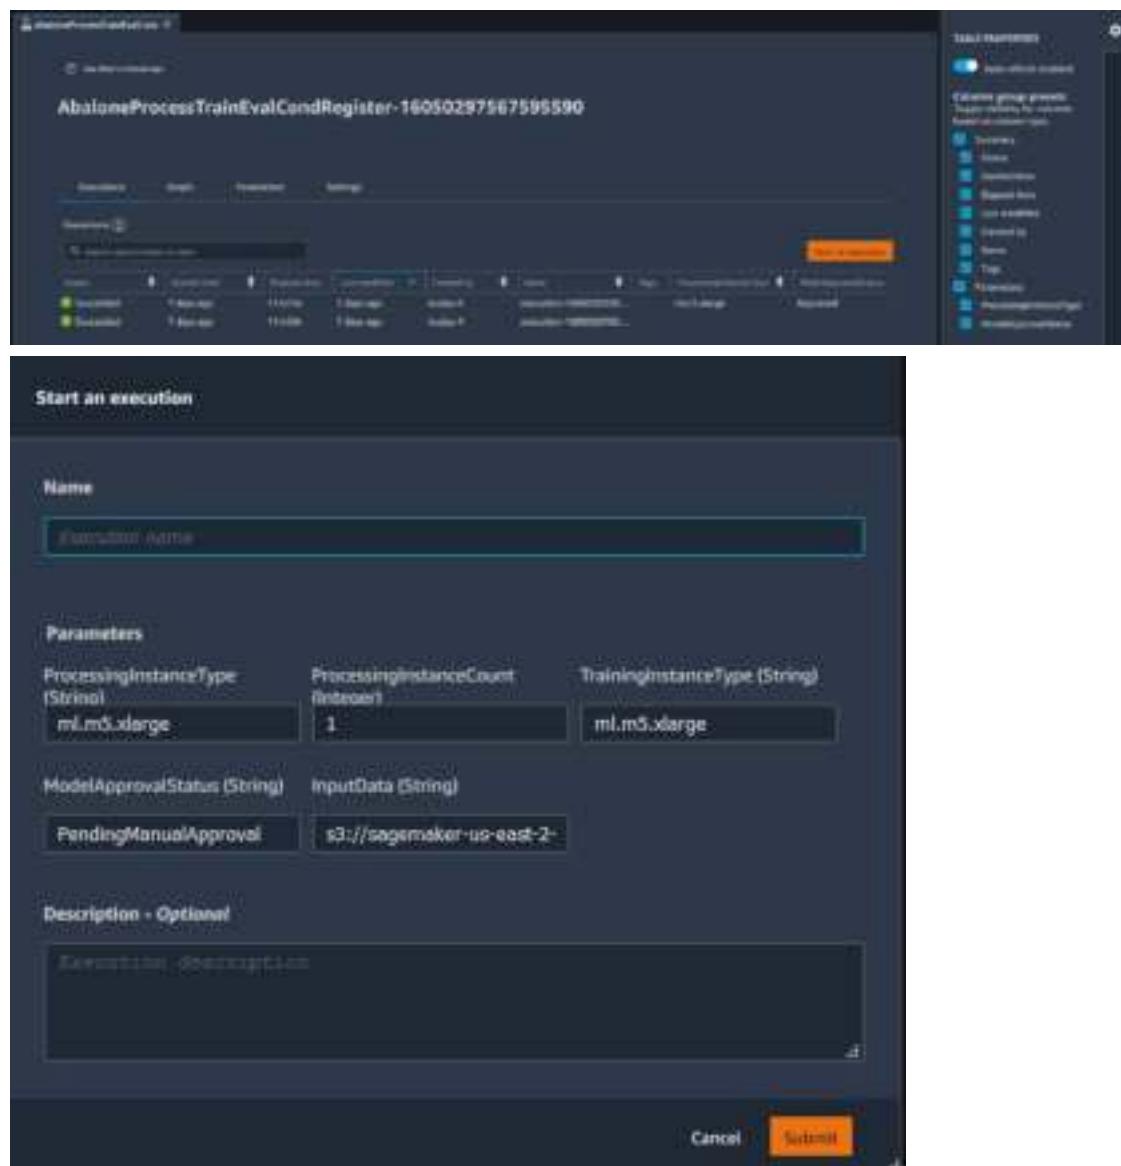

Trial Component List							
Status		Experiment name	Trial name	Trial component name	Trial component type	Created	Last modified
Completed	pipeline-experiment	pipeline-experiment	pipeline-trial	pipeline-step1-step47	Processing job	24 minutes ago	19 minutes ago
Completed	pipeline-experiment	pipeline-experiment	pipeline-trial	pipeline-step1-step47	Training job	25 minutes ago	23 minutes ago
Completed	pipeline-experiment	pipeline-experiment	pipeline-trial	pipeline-step1-step47	Processing job	25 minutes ago	23 minutes ago

### Execute a Pipeline

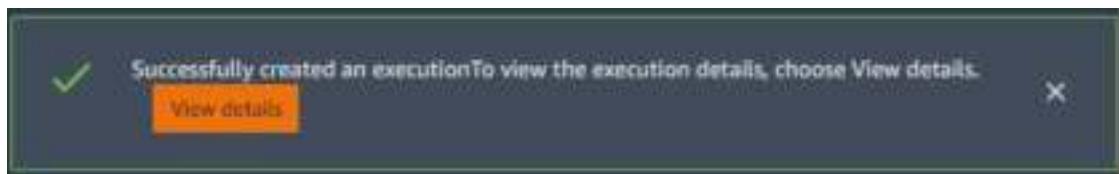

This procedure shows you how to execute a pipeline. For information on how to view a list of pipeline executions, see [View a Pipeline \(p. 2218\)](#).

#### To start a pipeline execution

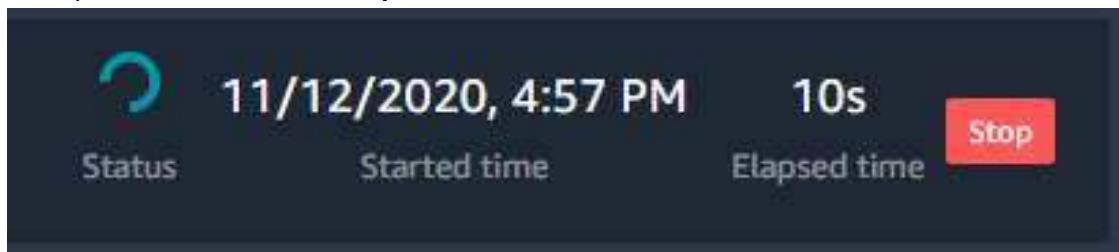

1. From the **Executions** or **Graph** tab in the execution list, choose **Start an execution**.

2. Enter or update the following required information:
  - **Name** – Must be unique to your account in the Amazon Region.
  - **ProcessingInstanceType** – The instance type for processing.
  - **ProcessingInstanceCount** – The number of instances to use for processing.
  - **TrainingInstanceType** – The instance type for training.
  - **ModelApprovalStatus** – For your convenience.
  - **InputData** – The S3 URI of the input data.
3. Choose **Submit**.
4. To see details of the execution or to stop the execution, choose **View details** on the status banner.

5. To stop the execution, choose **Stop** on the status banner.

To view the list of registered models, see [Automate MLOps with SageMaker Projects \(p. 2232\)](#).

## Track the Lineage of a SageMaker ML Pipeline

In this tutorial, you use Amazon SageMaker Studio to track the lineage of an Amazon SageMaker ML Pipeline.

The pipeline was created by the [Orchestrating Jobs with Amazon SageMaker Model Building Pipelines](#) notebook in the [Amazon SageMaker example GitHub repository](#). For detailed information on how the pipeline was created, see [Define a Pipeline \(p. 2201\)](#).

Lineage tracking in Studio is centered around a directed acyclic graph (DAG). The DAG represents the steps in a pipeline. From the DAG you can track the lineage from any step to any other step. The following diagram displays the steps in the pipeline. These steps appear as a DAG in Studio.

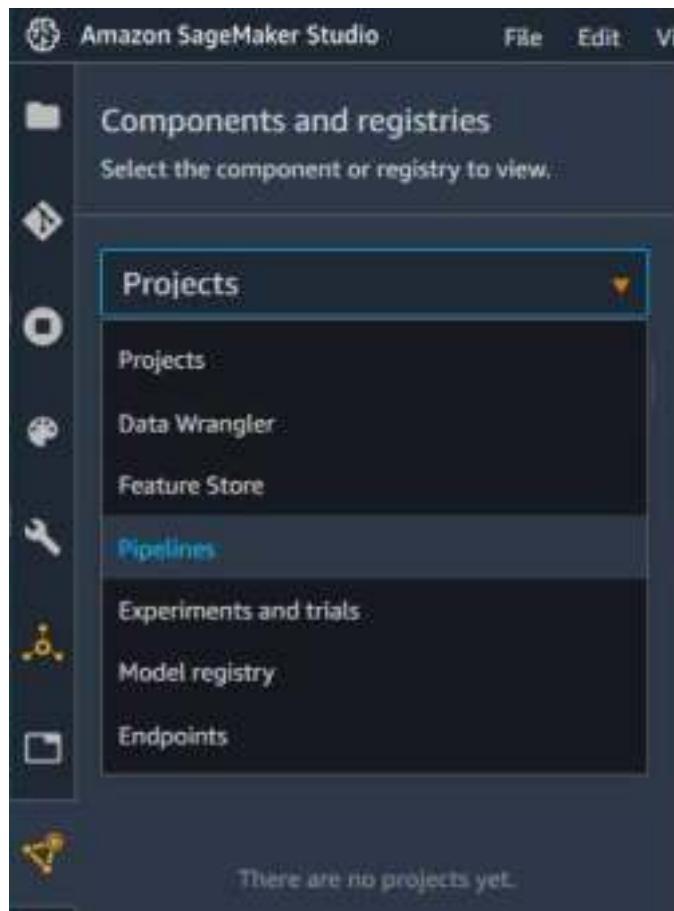

### Prerequisites

- Access to Amazon SageMaker Studio. For more information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).
- Familiarity with the SageMaker Studio user interface. For more information, see [Amazon SageMaker Studio UI Overview \(p. 69\)](#).
- (Recommended) A completed run of the example notebook.

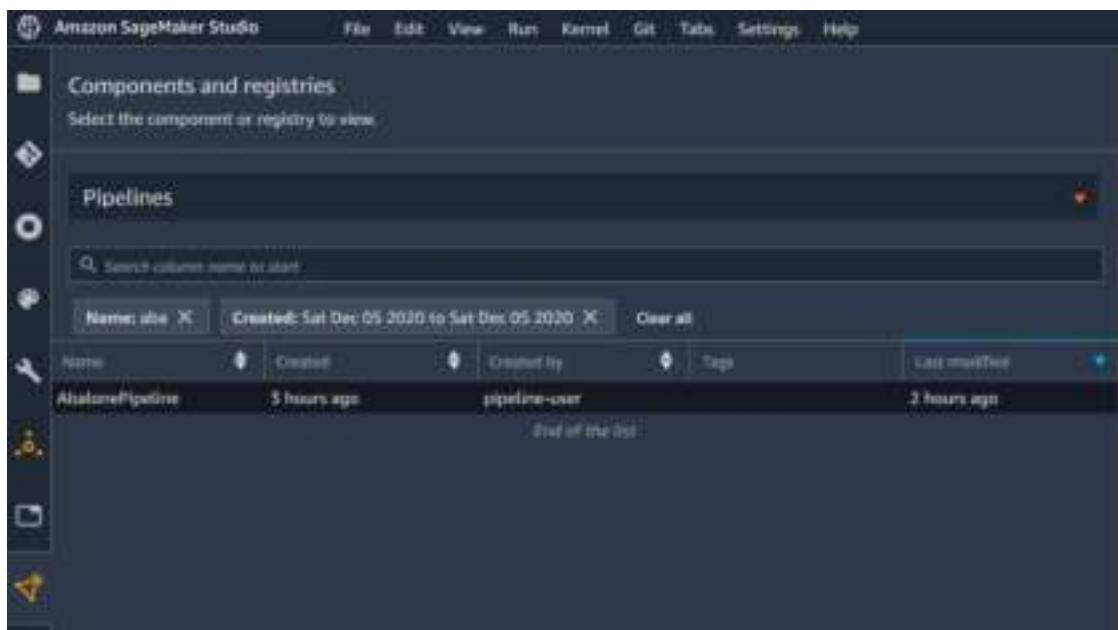

### To track the lineage of a pipeline

1. Sign in to SageMaker Studio.
2. In the left sidebar of Studio, choose the **SageMaker Components and registries** icon (💡).
3. In the drop-down menu, select **Pipelines**.

4. Use the **Search** box to filter the pipelines list. To view all available columns, drag the right border of the pane to the right. For more information, see [Search Experiments Using Amazon SageMaker Studio \(p. 1567\)](#).

The following screenshot shows the list filtered by a name that starts with "aba" and that was created on 12/5/20.

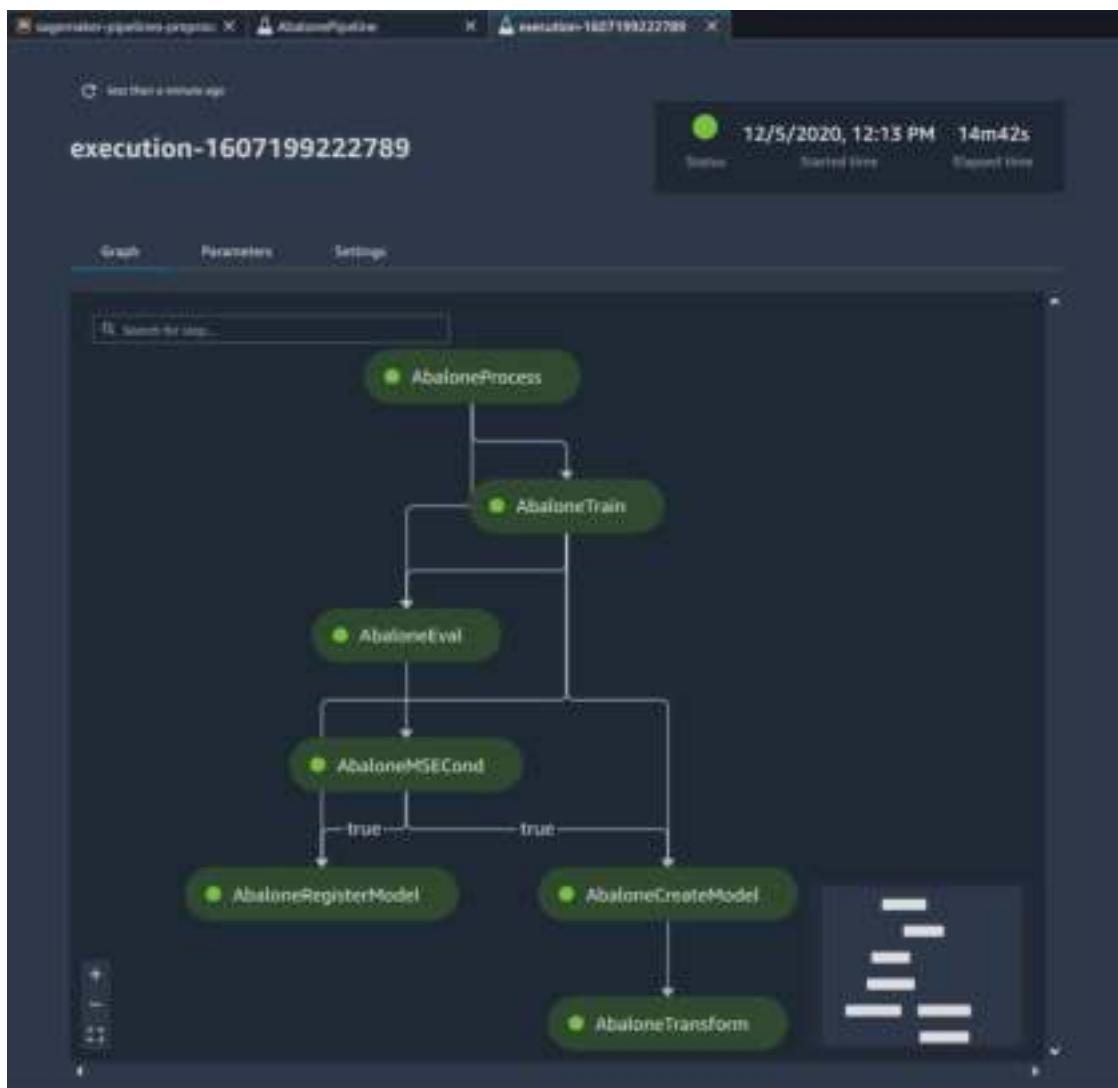

- Double-click the AbalonePipeline pipeline to view the execution list and other details about the pipeline. The following screenshot shows the **TABLE PROPERTIES** pane open where you can choose which properties to view.

- Choose the **Settings** tab and then choose **Download pipeline definition file**. You can view the file to see how the pipeline graph was defined.
- On the **Execution** tab, double-click the first row in the execution list to view its execution graph and other details about the execution. Note that the graph matches the diagram displayed at the beginning of the tutorial.

You can drag the graph around (select an area not on the graph itself) or use the resizing icons on the lower-left side of the graph. The inset on the lower-right side of the graph displays your location in the graph.

8. On the **Graph** tab, choose the **AbaloneProcess** step to view details about the step.

9. Find the Amazon S3 paths to the training, validation, and test datasets in the **Output** tab, under **Files**.

**Note**

To get the full paths, right-click the path and then choose **Copy cell contents**.

```
s3://sagemaker-eu-west-1-acct-id/sklearn-abalone-process-2020-12-05-17-28-28-509/
output/train
s3://sagemaker-eu-west-1-acct-id/sklearn-abalone-process-2020-12-05-17-28-28-509/
output/validation
s3://sagemaker-eu-west-1-acct-id/sklearn-abalone-process-2020-12-05-17-28-28-509/
output/test
```

10. Choose the AbaloneTrain step.

11. Find the Amazon S3 path to the model artifact in the **Output** tab, under **Files**:

```
s3://sagemaker-eu-west-1-acct-id/AbaloneTrain/pipelines-6locnsqz4bfu-AbaloneTrain-NtfEpIOAhu/output/model.tar.gz
```

12. Choose the AbaloneRegisterModel step.

13. Find the ARN of the model package in the **Output** tab, under **Files**:

```
arn:aws:sagemaker:eu-west-1:acct-id:model-package/abalonemodelpackagegroupname/2
```

## Automate MLOps with SageMaker Projects

Create end-to-end ML solutions with CI/CD by using SageMaker projects.

Use SageMaker projects to create an ML ops solution to orchestrate and manage:

- Data preparation and feature engineering
- Training models
- Evaluating models
- Deploying models

- Monitor and update models

#### Topics

- [What is a SageMaker Project? \(p. 2233\)](#)
- [Why Should You Use MLOps? \(p. 2234\)](#)
- [SageMaker Studio Permissions Required to Use Projects \(p. 2236\)](#)
- [Create an MLOps Project \(p. 2236\)](#)
- [MLOps Project Templates \(p. 2240\)](#)
- [View Project Resources \(p. 2242\)](#)
- [SageMaker MLOps Project Walkthrough \(p. 2244\)](#)

## What is a SageMaker Project?

By using a SageMaker project, teams of data scientists and developers can work in machine learning business problems. You can create a SageMaker project with a SageMaker provided MLOPs template that automates the model building and deployment pipelines using continuous integrations and continuous delivery (CI/CD). A SageMaker provided template provisions the initial setup required for a complete end-to-end MLOps system including model building, training, and deployment, depending on the template you choose. You can also provide your own custom template to provision the resources you need for your MLOps system.

A SageMaker project is an Amazon Service Catalog provisioned product that enables you to easily create an end-to-end ML solution. For information about Amazon Service Catalog, see [What is Amazon Service Catalog](#).

Each SageMaker project has a unique name and ID that are passed to all SageMaker and Amazon resources created in the project. By using the name and ID, you can view all entities associated with your project. These include:

- Pipeline executions
- Registered models
- Deployed models (endpoints)
- Datasets
- Amazon Service Catalog Products
- Amazon CodePipeline pipelines
- Amazon CodeCommit repositories

A typical SageMaker project with a CICD template might include the following.

- One or more CodeCommit repositories with sample code for building and deploying ML solutions. These are working examples that you can clone locally to explore the code provided by SageMaker and modify for your needs. You own this code and you can use the repositories as version control for your work.
- A SageMaker pipeline that defines steps for data preparation, training, model evaluation, and model deployment.
- A CodePipeline that runs your SageMaker pipeline every time a new version of the code is checked in. For information about CodePipeline, see [What is Amazon CodePipeline](#).
- A model group that contains model versions. Each time the SageMaker pipeline runs, and the resulting model version is accepted in the conditional validation step, a new model version is deployed to a SageMaker endpoint.

## When Should You Use a SageMaker Project?

While notebooks are helpful for model building and experimentation, when you have a team of data scientists and/or ML engineers working on an ML problem, you need a more scalable way to maintain code consistency and have stricter version control. Having the code only in notebook files makes it harder to collaborate and risks losing code or model artifacts if the notebook is accidentally deleted or changed. By using SageMaker projects, you can manage the versions for your Git repositories so you can collaborate across teams more efficiently, ensure code consistency, and enable CI/CD.

In addition to managing code, SageMaker projects enable MLOps for model building, model deployment, and end-to-end ML workflows. You can run training jobs or SageMaker pipelines to build models in SageMaker Studio. However, if you want to create a CI/CD system that generates models based on triggers, such as when someone checks in a code change, then consider creating a SageMaker project and using a SageMaker provided template. For a list of the project templates that SageMaker provides, see [Use SageMaker Provided Project Templates \(p. 2241\)](#).

## Do I Need to Create a Project to Use SageMaker Pipelines?

No. SageMaker pipelines are standalone entities just like training jobs, processing jobs, and other SageMaker jobs within SageMaker. You can create, update, and run pipelines directly within a notebook by using the SageMaker Python SDK without using a SageMaker project.

Projects provide an additional layer to help you organize your code and adopt operational best practices that you need for a production-quality system.

## Why Should You Use MLOps?

As you move from running individual artificial intelligence and machine learning (AI/ML) projects to using AI/ML to transform your business at scale, the discipline of ML Operations (MLOps) can help. MLOps accounts for the unique aspects of AI/ML projects in project management, CI/CD, and quality assurance, helping customers improve delivery time, reduce defects, and make data scientists more productive. MLOps refers to a methodology that is built on applying DevOps practices to machine learning workloads. You can review the [Introduction to DevOps on Amazon](#) white paper for a discussion of DevOps principles. [Practicing CI/CD on Amazon](#) and [Infrastructure as Code](#) go deeper into implementation using Amazon services.

Like DevOps, MLOps relies on a collaborative and streamlined approach to the machine learning development lifecycle where the intersection of people, process and technology are required to optimize the end-to-end activities required to develop, build, and operate machine learning workloads.

MLOps focuses on the intersection of data science and data engineering in combination with existing DevOps practices to streamline model delivery across the machine learning development lifecycle. MLOps is the discipline of integrating ML workloads into release management, CI/CD, and operations. MLOps requires the integration of software development, operations, data engineering, and data science.

## Challenges with MLOps

- **Project management** - ML projects involve data scientists, a relatively new role, and one not often integrated into cross-functional teams. These new team members often speak a very different technical language than product owners and software engineers, compounding the usual problem of translating business requirements into technical requirements.
- **Communication and collaboration** - Building visibility on ML projects and enabling collaboration across different stakeholders such as data engineers, data scientists, ML engineers, and DevOps.
- **Everything is code**

- Use of production data in development activities, longer experimentation lifecycles, dependencies on data pipelines, retraining deployment pipelines, and unique metrics in evaluating the performance of a model.
- Models often have a lifecycle independent of the applications and systems integrating with those models.
- The entire end-to-end system is reproducible through versioned code and artifacts. DevOps projects use Infrastructure-as-Code(IaC) and Configuration-as-Code(CaC) to build environments, and Pipelines-as-code to ensure consistent CI/CD patterns. The pipelines have to integrate with Big Data and ML training workflows. That often means that our pipeline is a combination of a traditional CI/CD tool and another workflow engine. There are important policy concerns for many ML projects, so our pipeline may also need to enforce those policies. Biased input data produces biased results, an increasing concern for business stakeholders.
- **CI/CD**
  - In MLOps, the source data is a first-class input, along with source code. That's why MLOps calls for versioning the source data and triggering pipeline runs when the source or inference data changes.
  - Pipelines must also version the ML models along with their inputs and other outputs, in order to provide for traceability.
  - Automated testing must include proper validation of the ML model, during build phases and when the model is in production.
  - Build phases may include model training and retraining, a time-consuming and resource-intensive process. Pipelines must be granular enough to only perform a full training cycle when the source data or ML code changes, not when related components change.
  - Because machine learning code is typically a small part of an overall solution, a deployment pipeline may also incorporate the additional steps required to package your model for consumption as an API by other applications and systems.
- **Monitoring and logging**
  - In the feature engineering and model training phases, we need to capture model training metrics as well as model experiments. Tuning an ML model requires manipulating the form of the input data as well as algorithm hyperparameters, and we need to systematically capture those experiments. Experiment tracking helps data scientists work more effectively and gives us a reproducible snapshot of their work.
  - Deployed ML models require monitoring of the data passed to the model for inference, along with the standard endpoint stability and performance metrics. The monitoring system must also capture the quality of model output, as evaluated by an appropriate ML metric.

## Benefits of MLOps

Adopting MLOps practices gives you faster time-to-market for ML projects by delivering the following benefits.

- **Productivity** - Providing self-service environments with access to curated data sets lets data engineers and data scientists move faster and waste less time with missing or invalid data.
- **Repeatability** - Automating all the steps in the MLDC helps you ensure a repeatable process, including how the model is trained, evaluated, versioned, and deployed.
- **Reliability** - Incorporating CI/CD practices allows for the ability to not only deploy quickly but with increased quality and consistency.
- **Auditability** - Versioning all inputs and outputs, from data science experiments to source data to trained model, means that we can demonstrate exactly how the model was built, and where it was deployed.
- **Data and model quality** - MLOps lets us enforce policies that guard against model bias and track changes to data statistical properties and model quality over time.

# SageMaker Studio Permissions Required to Use Projects

To enable users to view SageMaker provided project templates and create projects with those templates, enable **Projects** permissions for users when you onboard or update SageMaker Studio. There are 2 permissions to enable.

1. Enable **Projects** permissions for the SageMaker Studio administrator. This enables the SageMaker Studio administrator to view the SageMaker provided templates in the Amazon Service Catalog console. The administrator can see what other SageMaker Studio users create if you grant them permission to use SageMaker projects. The administrator can also view the Amazon CloudFormation template that the SageMaker provided project templates define in the Service Catalog Console. For information about using the Service Catalog console, see [What Is Amazon Service Catalog](#) in the [Amazon Service Catalog User Guide](#).
2. Enable projects for SageMaker studio users who are configured to use the domain execution role. This grants permission for SageMaker Studio users the ability to use the SageMaker provided project templates to create a project from within SageMaker Studio.

To enable users who use any role other than the domain execution role to view and use SageMaker provided project templates, you need to enable **Projects** permissions on the individual user profiles.

The following procedures show how to enable **Projects** permissions when you are onboarding to SageMaker Studio. For more information about onboarding to SageMaker Studio, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).

## To enable Projects permissions for the administrator and domain execution role users

1. Open the [SageMaker console](#).
2. Choose **Amazon SageMaker Studio** at the top left of the page.
3. If you choose **Quick start**, under **Projects**, make sure **Enable SageMaker project templates for this account and Studio users** is enabled.  

4. If you choose **Standard setup**, under **Projects**, make sure both **Enable SageMaker project templates for this account** and **Enable SageMaker project templates for Studio users** are enabled.  

## Create an MLOps Project

Create a SageMaker MLOps project by using SageMaker studio.

### Prerequisites

To create a project in SageMaker Studio, you need:

- An Amazon Web Services SSO or IAM account to sign in to Studio. For information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).
- Basic familiarity with the Studio user interface and Jupyter notebooks. For information, see [Amazon SageMaker Studio UI Overview \(p. 69\)](#).

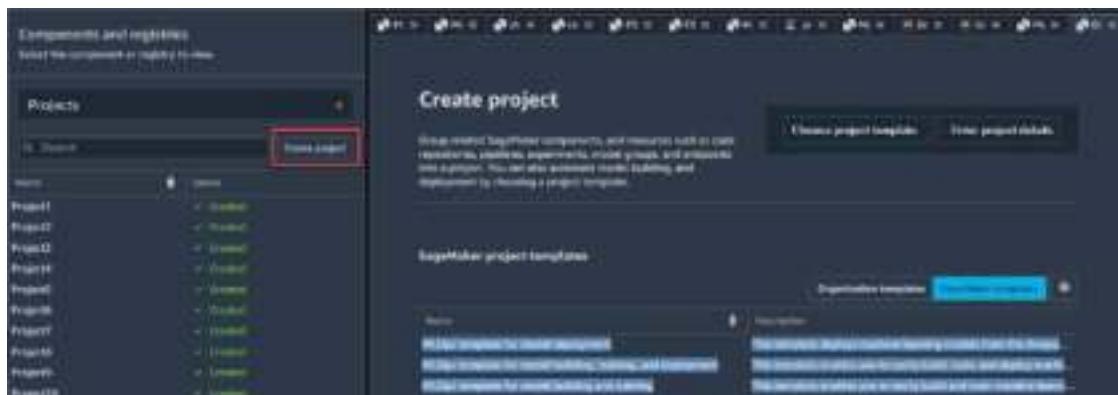

### To create a project in SageMaker Studio

1. Sign in to Studio. For more information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).
2. Choose **Components and registries**, and then choose **Projects** in the drop-down list.

The screenshot shows the 'Components and registries' interface in Amazon SageMaker Studio. On the left, there is a vertical toolbar with icons for different components: a folder, a play button, a square, a palette, a wrench, a triangle, a folder, a gear, and a network icon. The 'Projects' icon is highlighted with a red box. The main area has a dark header with the text 'Components and registries' and 'Select the component or registry to view.' Below this is a sub-header 'Projects' with a search bar and a 'Create project' button. A table lists ten projects: Project1 through Project10, all marked as 'Created'. The table has columns for 'Name' and 'Status'.

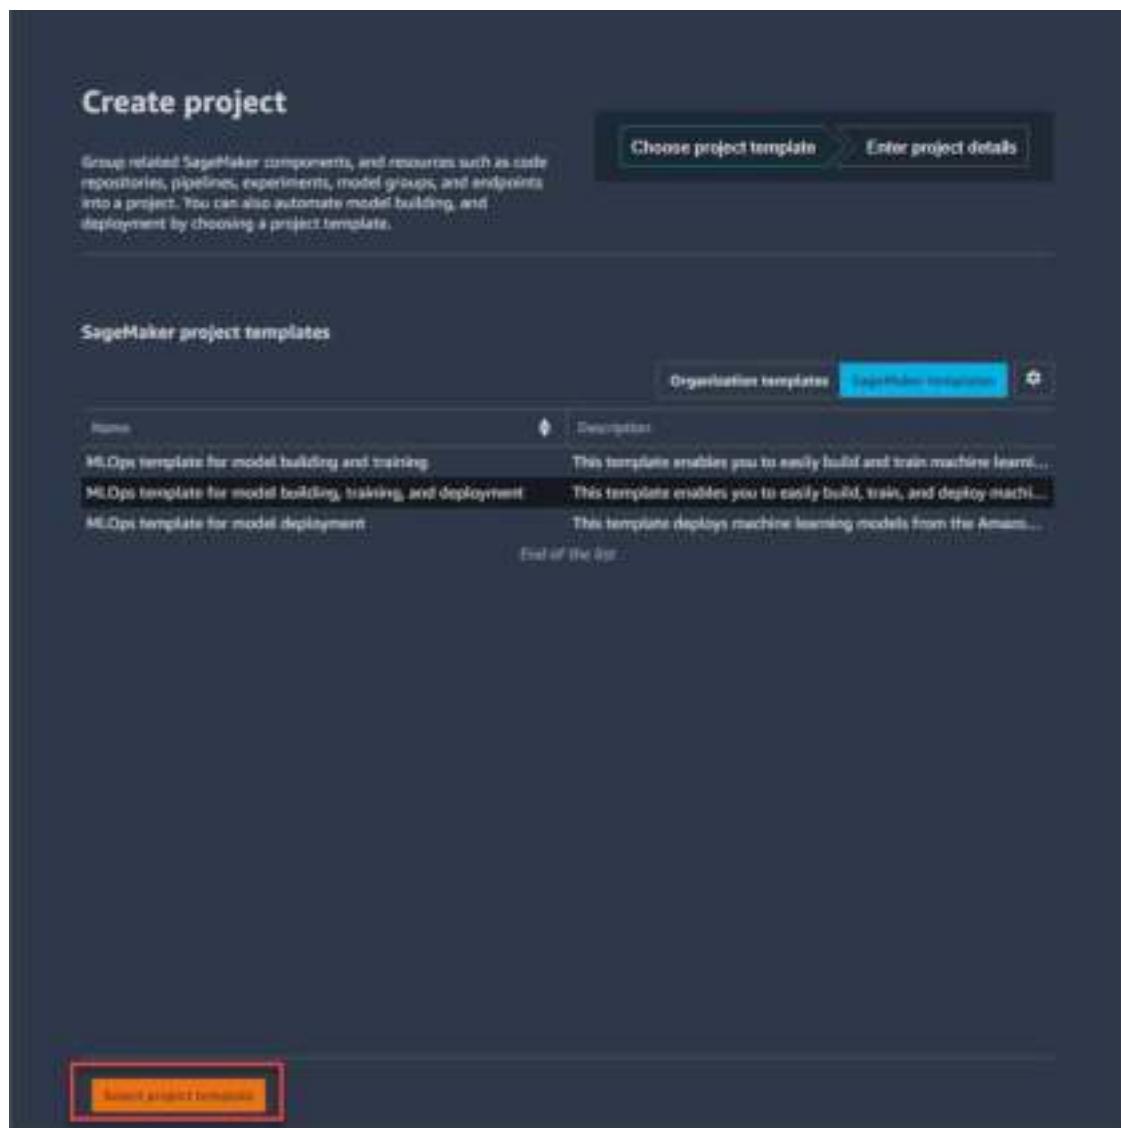

Name	Status
Project1	✓ Created
Project2	✓ Created
Project3	✓ Created
Project4	✓ Created
Project5	✓ Created
Project6	✓ Created
Project7	✓ Created
Project8	✓ Created
Project9	✓ Created
Project10	✓ Created

3. Choose **Create project**.

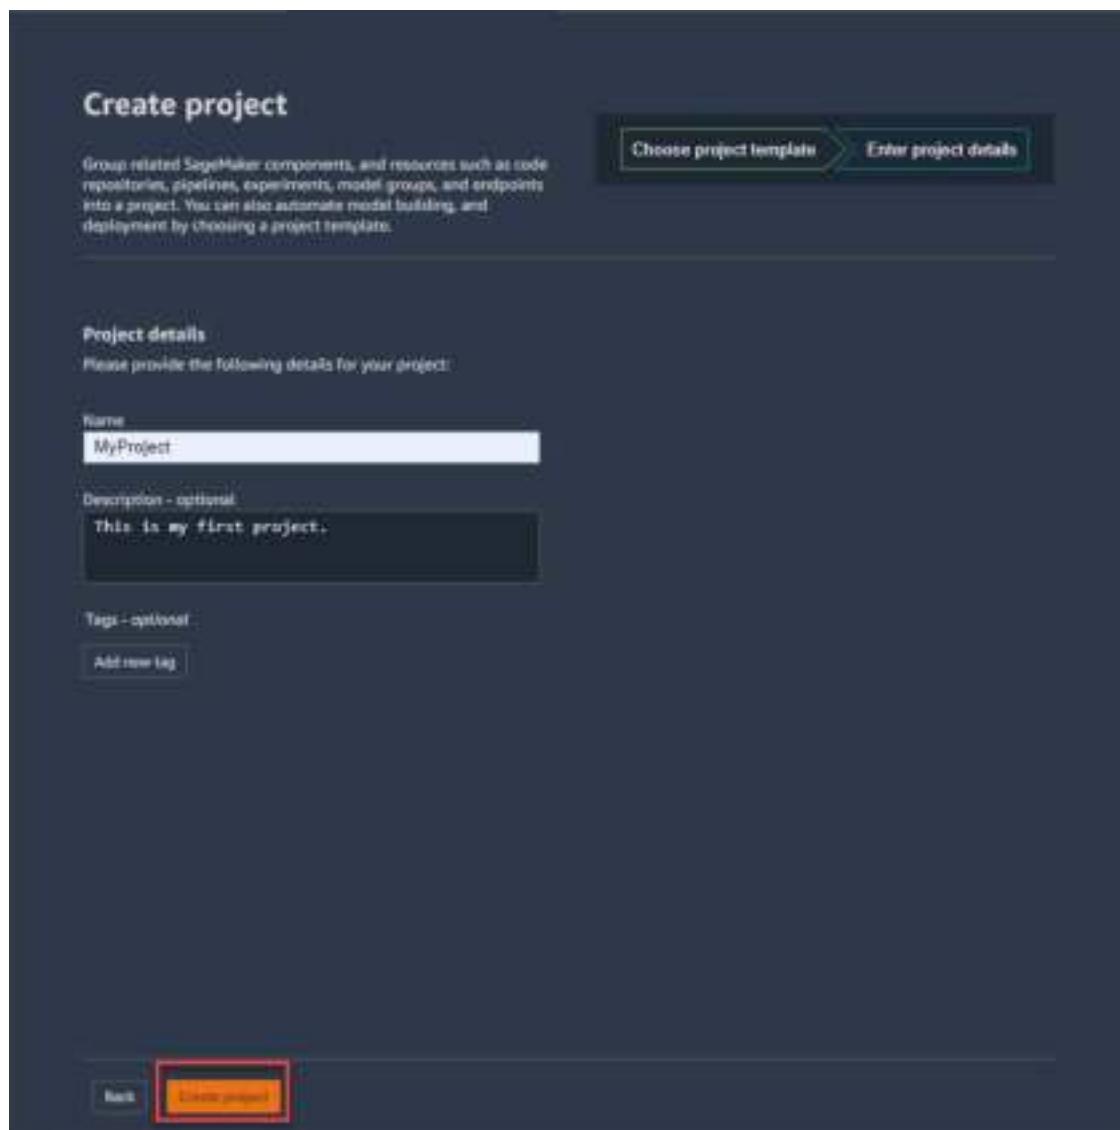

The **Create project** tab appears.

4. For **SageMaker project templates**, choose **Organization templates** to choose a custom template that your organization created, or **SageMaker templates** to choose a SageMaker-provided template. Then choose a template from the list of available templates, and choose **Choose project template**. For more information about project templates, see [MLOps Project Templates \(p. 2240\)](#).

5. For **Project details** enter a name and description for your project. Optionally, add tags, which are key value pairs that you can use to track your projects. When you are finished, choose **Create project**

## MLOps Project Templates

A SageMaker project template automates setting up and implementing MLOps for your projects. A SageMaker project template is an Amazon Service Catalog product that SageMaker makes available to SageMaker Studio users. These Service Catalog products are visible in your Service Catalog console after you enable permissions when you onboard or update SageMaker Studio. For information about enabling permissions to use SageMaker project templates, see [SageMaker Studio Permissions Required to Use Projects \(p. 2236\)](#). Use SageMaker project templates to create a project that is an end-to-end MLOps solution.

If you are an administrator, you can create your own custom project templates. SageMaker Studio users in your organization can use custom project templates that you create to create projects.

### Topics

- [Use SageMaker Provided Project Templates \(p. 2241\)](#)
- [Create Custom Project Templates \(p. 2241\)](#)

## Use SageMaker Provided Project Templates

SageMaker provides project templates that create the infrastructure you need to create an MLOps solution. Currently, SageMaker offers the following project templates.

- **MLOps template for model building and training** - This template enables you to build and train machine learning models and register models to the model registry. Use this template when you want a MLOps solution for building and training models. This template provides the following resources:
  - An Amazon CodeCommit repository that contains sample code that creates SageMaker pipeline in python code and shows how to create and update a SageMaker pipeline. This repository also has a Python Jupyter notebook that you can open and run in SageMaker Studio.
  - A CodePipeline that has source and build steps. The source step points to the CodeCommit repository and the build step gets the code from that repository, creates and/or updates the SageMaker pipeline, starts a pipeline execution, and waits for the pipeline execution to complete.
  - An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

In a collaborative environment with multiple Studio users working on a same project, we recommend creating this project. After data scientists experiment in SageMaker Studio and check their code into CodeCommit, model building and training happens in the common infrastructure so that there is a central, authoritative location to keep track of the ML Models and artifacts that are ready to go to production.

- **MLOps template for model deployment** - This template deploys machine learning models from the Amazon SageMaker model registry to SageMaker hosted endpoints for real-time inference. Use this template when you have trained models that you want to deploy for inference. This template provides the following resources:
  - An Amazon CodeCommit repository that contains sample code that deploys models to endpoints in staging and production environments.
  - A CodePipeline that has source, build, deploy to staging, and deploy to production steps. The source step points to the CodeCommit repository, the build step gets the code from that repository, generates Amazon CloudFormation stacks to deploy. The deploy to staging and deploy to production steps deploy the Amazon CloudFormation stacks to their respective environments. There is a manual approval step between the staging and production build steps, so that a MLOps engineer must approve the model before it is deployed to production.

There is also a programmatic approval step with placeholder tests in the example code in the CodeCommit repository. You can add additional tests to replace the placeholders tests.

- An Amazon S3 bucket to store artifacts, including CodePipeline and CodeBuild artifacts, and any artifacts generated from the SageMaker pipeline runs.

This template recognizes changes in the model registry. When a new model version is registered and approved, it automatically triggers a deployment.

- **MLOps template for model building, training, and deployment** - This template enables you to easily build, train, and deploy machine learning models. Use this template when you want a complete MLOps solution from data preparation to model deployment.

This template is a combination of the previous 2 templates, and contains all of the resources provided in those templates.

## Create Custom Project Templates

If the SageMaker provided templates do not meet your needs (for example, you want to have more complex orchestration in the CodePipeline with multiple stages, custom approval steps, etc.) create your own templates.

We recommend starting by using SageMaker provided templates to understand how to organize your code and resources and build on top of it. To do this, after you enable administrator access to the SageMaker templates, login to the <https://console.amazonaws.cn/servicecatalog/>, choose **Portfolios**, then choose **Imported**. For information about Amazon Service Catalog, see [Overview of Amazon Service Catalog](#) in the *Amazon Service Catalog User Guide*.

Create your own project templates to customize your MLOps project. SageMaker project templates are Amazon Service Catalog provisioned products to provision the resources for your MLOps project.

To create a custom project template, complete the following steps.

1. Create a Portfolio. For information, see [Step 3: Create an Amazon Service Catalog Portfolio](#).
2. Create a Product. A Product is a Amazon CloudFormation template. You can create multiple versions of the product. For information, see [Step 4: Create an Amazon Service Catalog Product](#).

For the Product to work with SageMaker projects, add the following parameters to your Product template.

```
SageMakerProjectName:  
  Type: String  
  Description: Name of the project  
  
SageMakerProjectId:  
  Type: String  
  Description: Service generated Id of the project.
```

3. Add a launch constraint. A launch constraint designates an IAM role that Service Catalog assumes when a user launches a product. For information, see [Step 6: Add a Launch Constraint to Assign an IAM Role](#).
4. Provision the product on the <https://console.amazonaws.cn/servicecatalog/> to test the template. If you are satisfied with your template, continue to the next step to make the template available in SageMaker Studio.
5. Grant access to the Service Catalog Portfolio that you created in step 1 to your SageMaker Studio execution role. Use either the SageMaker Studio domain execution role or a user role that has SageMaker Studio access. For information about adding a role to the Portfolio, see [Step 7: Grant End Users Access to the Portfolio](#).
6. To make your project template available in your **Organization templates** list in SageMaker Studio, create a tag with the following key and value to the Service Catalog Product you created in step 2.
  - **key** - sagemaker:studio-visibility
  - **value** - true

After you complete these steps, SageMaker Studio users in your organization can create a project with the template you created by following the steps in [Create an MLOps Project \(p. 2236\)](#) and choosing **Organization templates** when you choose a template.

## View Project Resources

After you create a project, view the resources associated with the project in SageMaker Studio.

### To create a project in SageMaker Studio

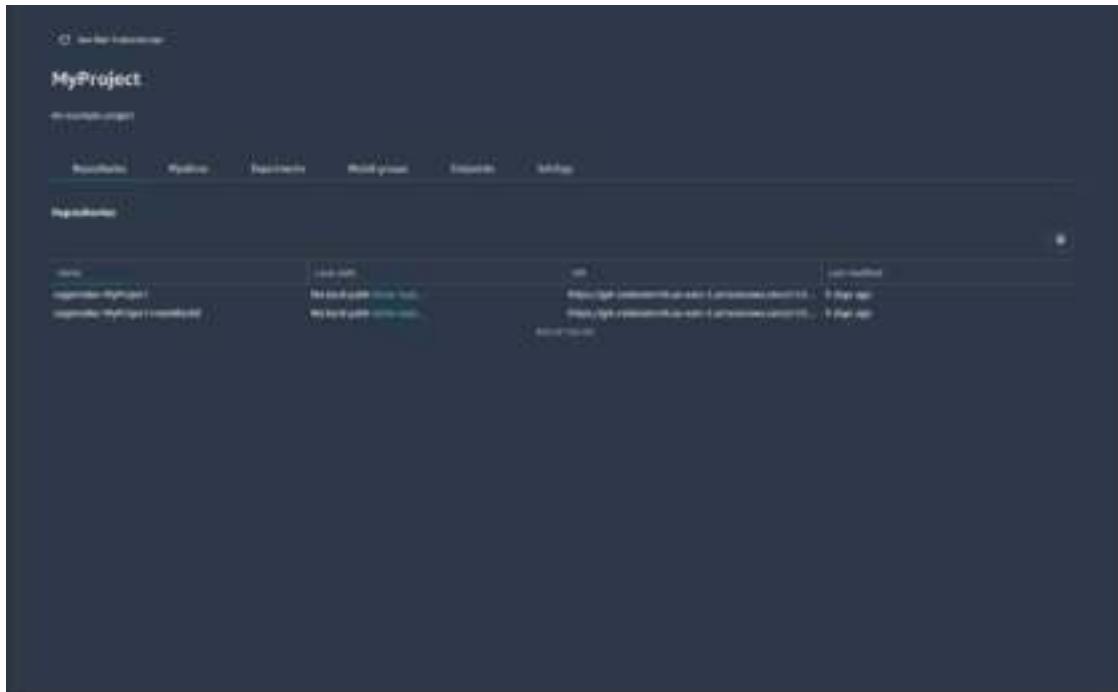

1. Sign in to Studio. For more information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).
2. Choose **Components and registries**, and then choose **Projects**.

The screenshot shows the 'Components and registries' section of the Amazon SageMaker console. On the left, there is a vertical sidebar with icons for different resources: a folder, a database, a square, a gear, a key, a network, a file, and a project. The 'Project' icon is highlighted with a red box. The main area has a title 'Components and registries' and a subtitle 'Select the component or registry to view.' Below this is a section titled 'Projects' with a search bar and a 'Create project' button. A table lists ten projects: Project1 through Project10, all marked as 'Created'. The 'Project8' row is also highlighted with a red box.

Name	Status
Project1	✓ Created
Project2	✓ Created
Project3	✓ Created
Project4	✓ Created
Project5	✓ Created
Project6	✓ Created
Project7	✓ Created
Project8	✓ Created
Project9	✓ Created
Project10	✓ Created

3. Double-click the name of the project for which you want to view details.

A tab with the project details appears.

On the product details tab, you can view the following entities associated with the project.

- **Repositories** - code repositories associated with this project. If you use a SageMaker provided template when you create your project, it creates Amazon CodeCommit pipelines. For more information about CodeCommit, see [What is Amazon CodeCommit](#)
- **Pipelines** - SageMaker ML pipelines that define steps to prepare data, train, and deploy models. For information about SageMaker ML pipelines, see [Create and Manage SageMaker Pipelines \(p. 2201\)](#).
- **Experiments** - one or more SageMaker AutoPilot experiments associated with the project. For information about AutoPilot, see [Automate model development with Amazon SageMaker Autopilot \(p. 142\)](#).
- **Model groups**- groups of model versions that were created by pipeline executions in the project. For information about model groups, see [Create a Model Group \(p. 2003\)](#).
- **Endpoints** - SageMaker endpoints that host deployed models for real-time inference. When a model version is approved, it is deployed to an endpoint.
- **Settings** - Settings for the project. This includes the name and description of the project, information about the project template and SourceModelPackageName, and metadata about the project.

## SageMaker MLOps Project Walkthrough

This walkthrough demonstrates how to use MLOps projects to create a CI/CD system to build, train, and deploy models.

### Prerequisites

To complete this walkthrough, you need:

- An Amazon Web Services SSO or IAM account to sign in to Studio. For information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).
- Permission to use SageMaker provided project templates. For information, see [SageMaker Studio Permissions Required to Use Projects \(p. 2236\)](#).

- Basic familiarity with the Studio user interface. For information, see [Amazon SageMaker Studio UI Overview \(p. 69\)](#).

#### Topics

- [Step 1: Create the Project \(p. 2245\)](#)
- [Step 2: Clone the Code Repository \(p. 2248\)](#)
- [Step 3: Make a Change in the Code \(p. 2250\)](#)
- [Step 4: Approve the Model \(p. 2253\)](#)
- [\(Optional\) Step 5: Deploy the Model Version to Production \(p. 2255\)](#)
- [Step 6: Cleanup Resources \(p. 2256\)](#)

## Step 1: Create the Project

In this step, you create a SageMaker MLOps project by using a SageMaker provided project template to build, train, and deploy models.

### To create the SageMaker MLOps project

1. Sign in to Studio. For more information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#).
2. Choose **Components and registries**, and then choose **Projects** in the drop-down list.

The screenshot shows the 'Components and registries' section of the SageMaker console. On the left is a vertical toolbar with icons for different components: folder, ML model, Lambda function, S3 bucket, Kinesis stream, and a key icon. Below the toolbar, the title 'Projects' is displayed above a search bar and a 'Create project' button. A table lists ten projects: Project1 through Project10, all in a 'Created' status. The 'key' icon in the toolbar is highlighted with a red box.

Name	Status
Project1	✓ Created
Project2	✓ Created
Project3	✓ Created
Project4	✓ Created
Project5	✓ Created
Project6	✓ Created
Project7	✓ Created
Project8	✓ Created
Project9	✓ Created
Project10	✓ Created

3. Choose **Create project**.

The screenshot shows the 'Create project' tab. The left sidebar displays a list of existing projects: Project1, Project2, Project3, Project4, Project5, Project6, Project7, Project8, Project9, and Project10. The 'Create project' tab itself has two tabs: 'Create project template' (selected) and 'Enter project details'. Below these tabs, there is descriptive text about creating a project and a list of 'SageMaker project templates'.

**Create project**

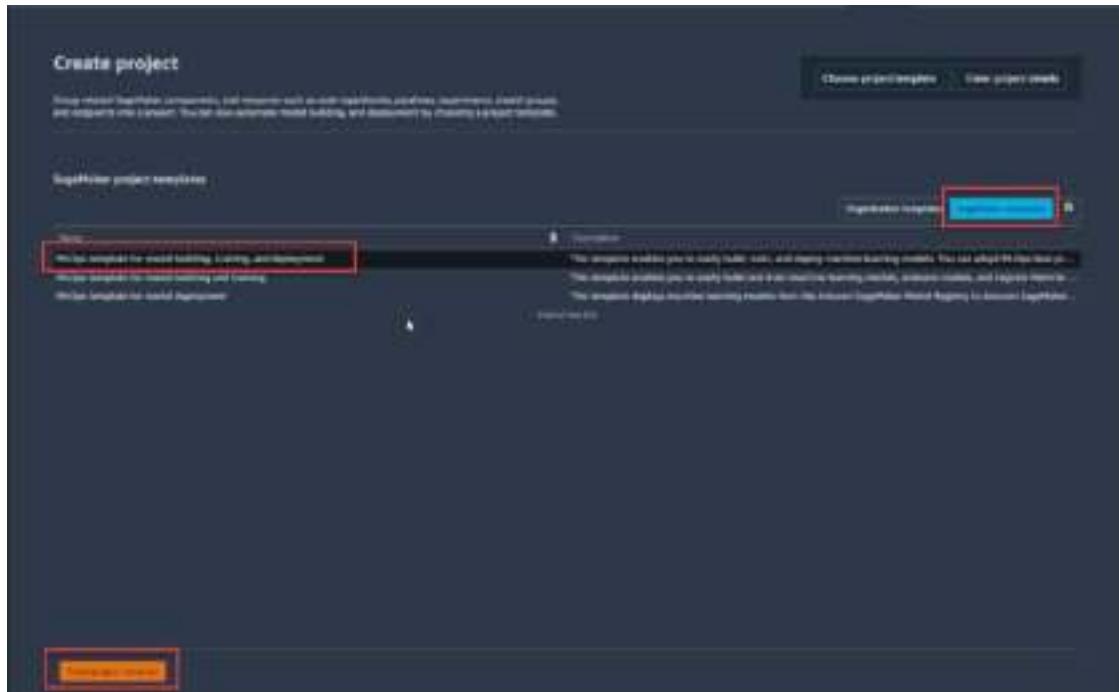

Create your first SageMaker components and resources such as code, training jobs, inference endpoints, model groups, and pipelines. With a project template, you can quickly build, train, and deploy by choosing a project template.

**SageMaker project templates**

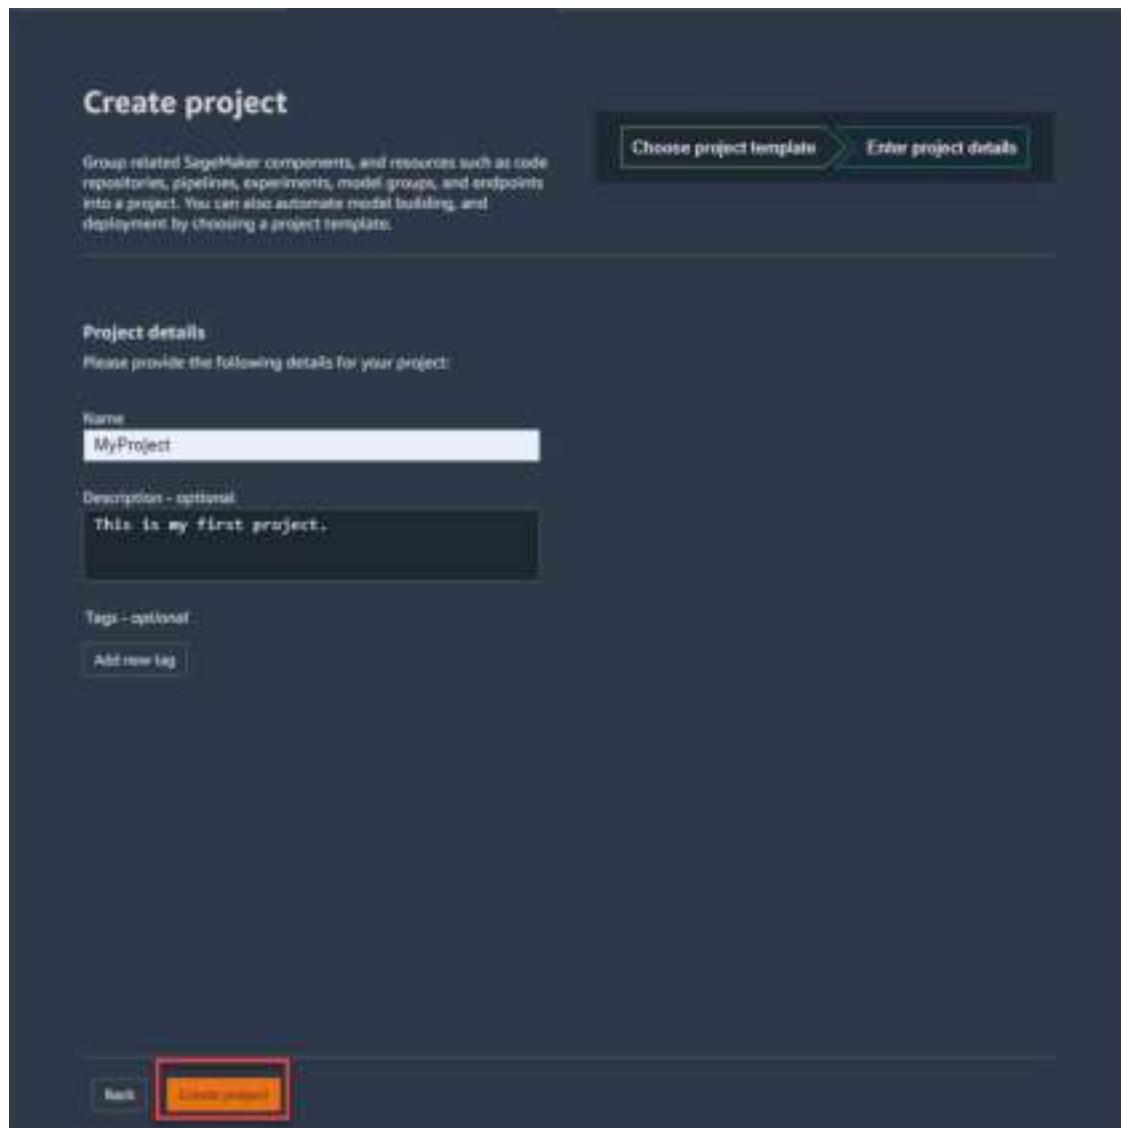

Name	Description
ML Project template for model training	ML Project template for model training
ML Project template for endpoint configuration and deployment	ML Project template for endpoint configuration and deployment
ML Project template for model hosting and serving	ML Project template for model hosting and serving
ML Project template for model training and deployment	ML Project template for model training and deployment

The **Create project** tab appears.

4. For **SageMaker project templates**, choose **Organization templates**, then choose **MLOps template for model building, training, and deployment**.

5. For **Project details** enter a name and description for your project. **Create project**

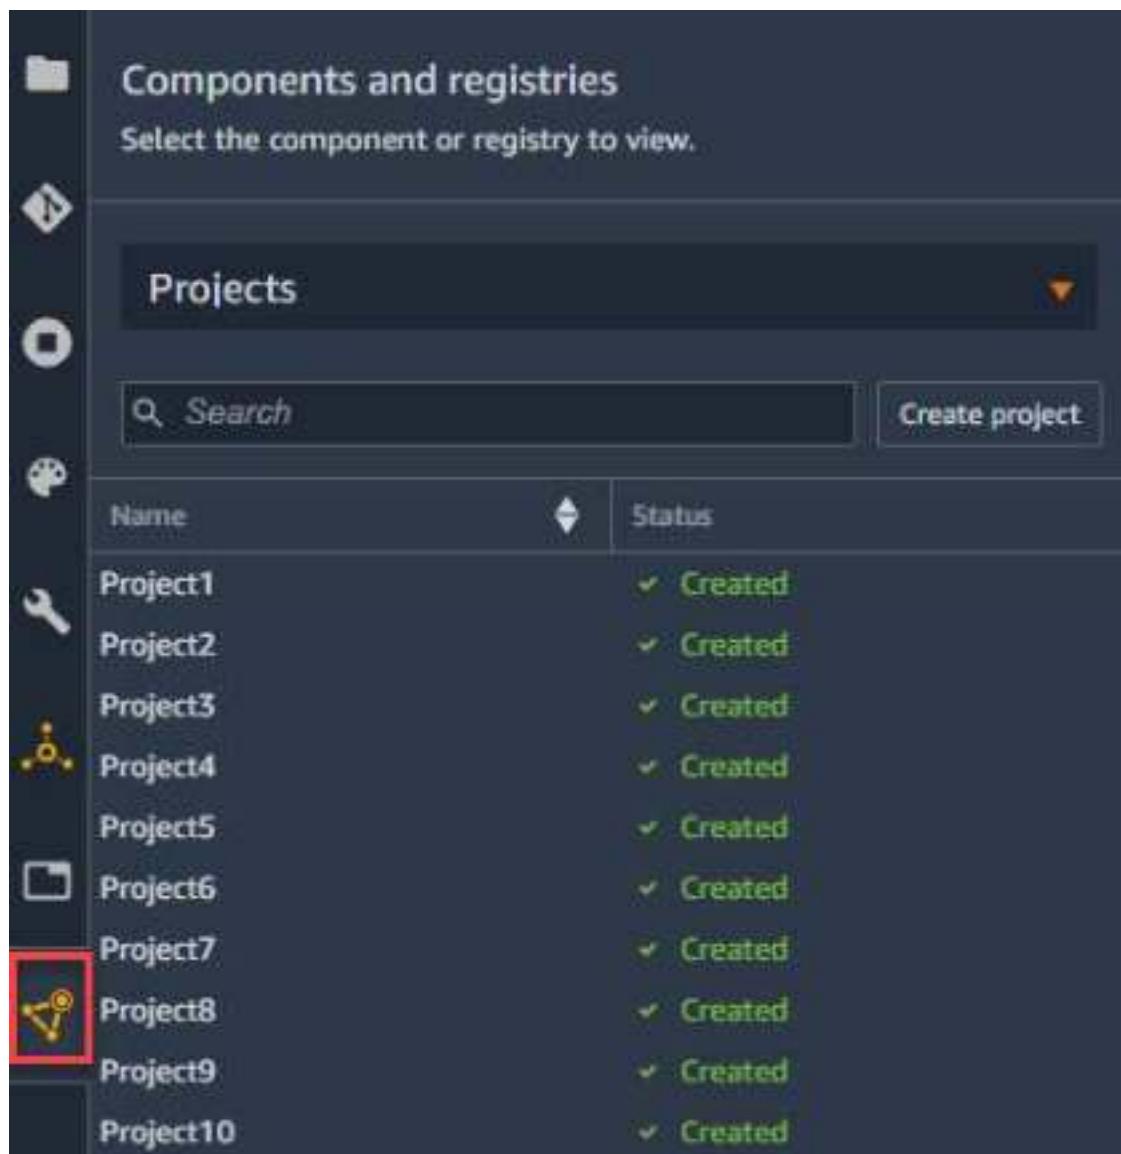

When the project appears in the **Projects** list with a **Status of Created**, move on to the next step.

## Step 2: Clone the Code Repository

After you create the project, two CodeCommit repositories are created in the project. One of the repositories contains code to build and train a model, and one contains code to deploy the model. In this step, you clone the repository to the local SageMaker that contains the code to build and train the model to the local SageMaker Studio environment so that you can work with the code.

### To clone the code repository

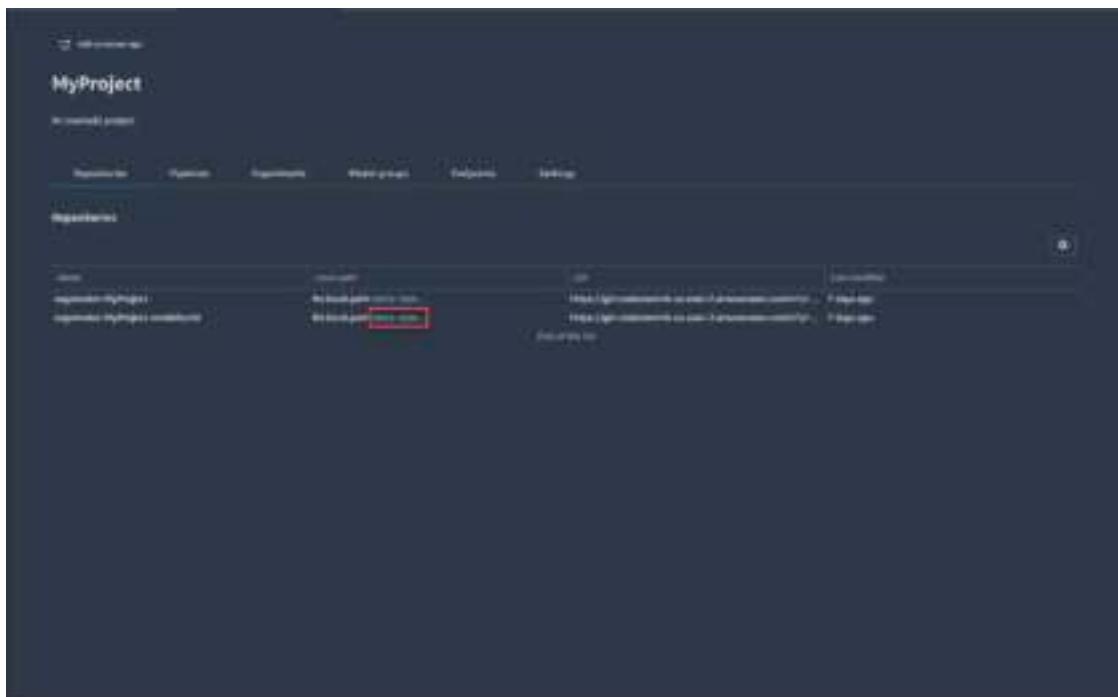

1. Choose **Components and registries**, and then choose **Projects** in the drop-down list.

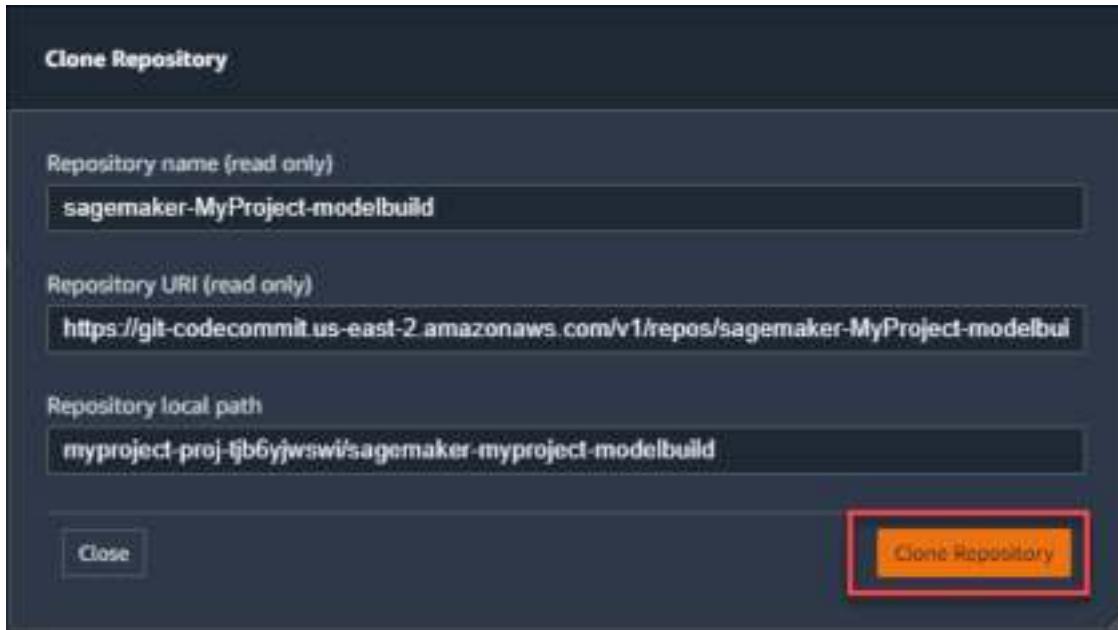

The screenshot shows the 'Components and registries' section of the Amazon SageMaker console. On the left, there is a vertical sidebar with icons for different components: a folder, a database, a square, a gear, a key, a network, a folder, and a magnifying glass. The magnifying glass icon is highlighted with a red box. The main area has a dark header with the title 'Components and registries' and the sub-instruction 'Select the component or registry to view.' Below this is a sub-header 'Projects' with a dropdown arrow. There is a search bar labeled 'Search' and a 'Create project' button. A table lists ten projects, each with a small icon and a status indicator:

Name	Status
Project1	✓ Created
Project2	✓ Created
Project3	✓ Created
Project4	✓ Created
Project5	✓ Created
Project6	✓ Created
Project7	✓ Created
Project8	✓ Created
Project9	✓ Created
Project10	✓ Created

2. Find the name of the project you created in the previous step and double-click on it to open the project tab for your project.
3. In the project tab, choose **Repositories**, and in the **Local path** column for the repository that ends with **modelbuild**, choose **clone repo...**

4. In the dialog box that appears, accept the defaults and choose **Clone repository**.

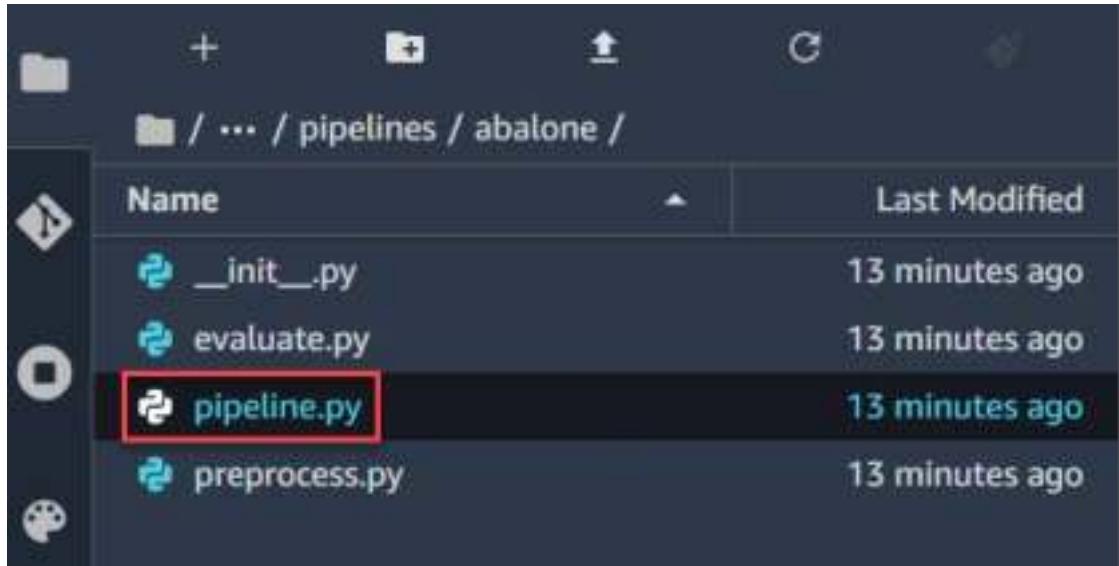

When clone of the repository is complete, the local path appears in the **Local path** column. Click on the path to open the local folder that contains the repository code in SageMaker Studio.

### Step 3: Make a Change in the Code

Now make a change to the pipeline code that builds the model and check in the change to trigger a new pipeline run. The pipeline run registers a new model version.

### To make a code change

1. In SageMaker Studio, choose the file browser icon (  ), and navigate to the pipelines/abalone folder. Double-click pipeline.py to open the code file.

2. In the pipeline.py file, find the line that sets the training instance type.

```
training_instance_type = ParameterString(  
    name="TrainingInstanceType", default_value="ml.m5.xlarge"
```

Change ml.m5.xlarge to ml.m5.large, then type Ctrl+S to save the change.

3. Choose the Git icon (  ). Stage, commit, and push the change in pipeline.py. For information about using Git in SageMaker Studio, see [Clone a Git Repository in SageMaker Studio \(p. 114\)](#).

The screenshot shows a Git commit interface with the following details:

- Current Repository:** sagemaker-myproject-p-kjwrgqlr05qn-modelbuild
- Current Branch:** master
- Changes Tab:** The "Changes" tab is selected.
- Staged:** 1 file: pipeline.py (M)
- Changed:** 0 files (0)
- Untracked:** 4 files:
  - .sagemaker-code-config (U)
  - Untitled-checkpoint.ipynb (U)
  - pipeline-checkpoint.py (U)

A message box at the bottom left says "Changed instance type".

The bottom right corner shows a red box around the "Commit" button, which is highlighted in blue.

At the very bottom, there are icons for terminal, file count (0), and Python, along with the text "Git: refreshing..." and the number 2252.

After pushing your code change, the MLOps system triggers a run of the pipeline that creates a new model version. In the next step, you approve the new model version to deploy it to production.

## Step 4: Approve the Model

Now you approve the new model version that was created in the previous step to trigger a deployment of the model version to a SageMaker endpoint.

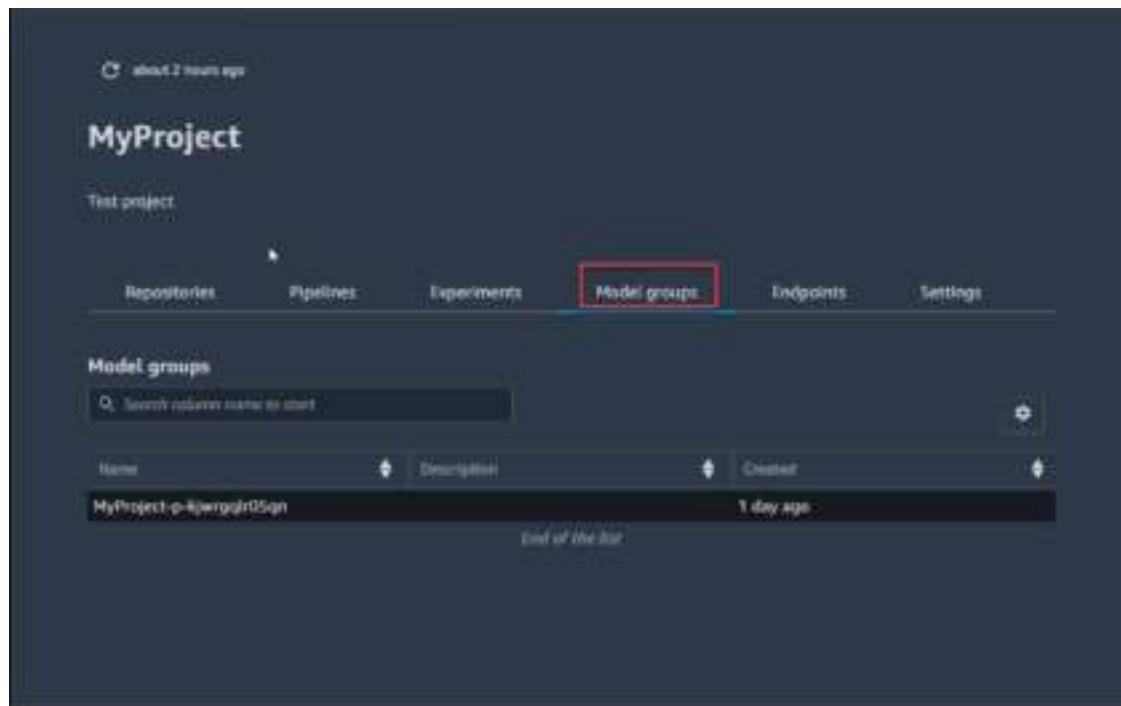

### To approve the model version

1. Choose **Components and registries**, and then choose **Projects** in the drop-down list.

The screenshot shows the 'Components and registries' interface with a sidebar containing icons for components like Lambda, Step Functions, and ML Models. The main area is titled 'Components and registries' with the sub-section 'Projects'. A search bar and a 'Create project' button are at the top of the list. The table below lists ten projects, each with a status of 'Created'.

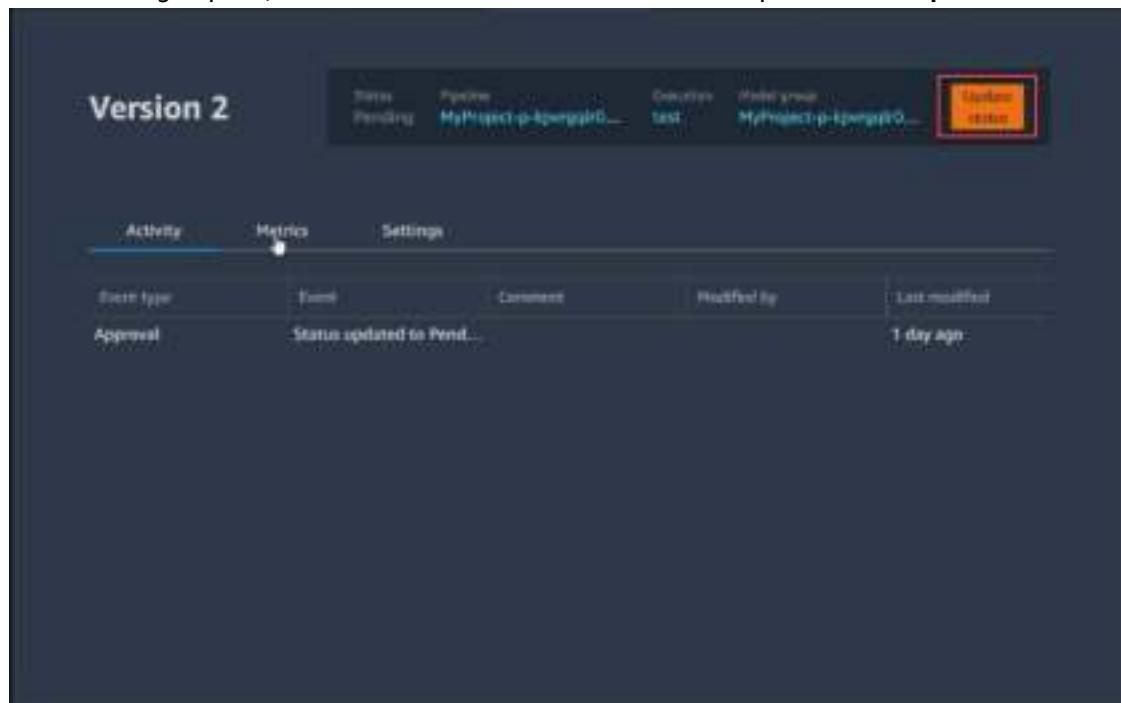

Name	Status
Project1	✓ Created
Project2	✓ Created
Project3	✓ Created
Project4	✓ Created
Project5	✓ Created
Project6	✓ Created
Project7	✓ Created
Project8	✓ Created
Project9	✓ Created
Project10	✓ Created

2. Find the name of the project you created in the first step and double-click on it to open the project tab for your project.
3. In the project tab, choose **Model groups**, then double-click the name of the model group that appears.

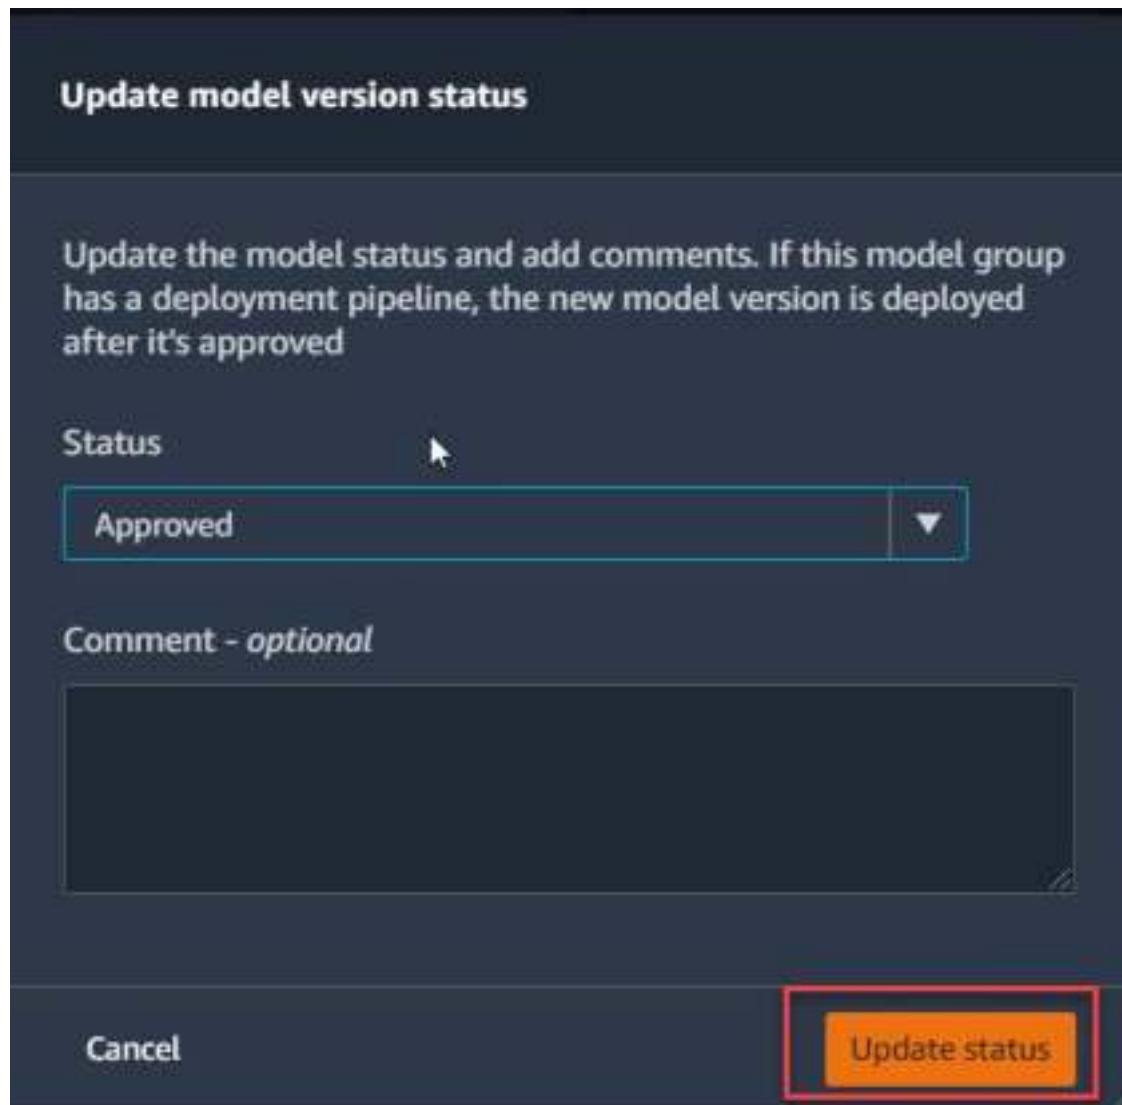

The model group tab appears.

4. In the model group tab, double-click **Version 2**. The **Version 2** tab opens. Choose **Update status**

5. In the model **Update model version status** dialog box, in the **Status** drop-down, choose **Approve**, then choose **Update status**.

Approving the model version causes the MLOps system to deploy the model to staging. To view the endpoint, choose the **Endpoints** tab on the project tab.

## (Optional) Step 5: Deploy the Model Version to Production

Now you can deploy the model version to the production environment.

**Note**

To complete this step, you need to be an administrator in your SageMaker Studio domain. If you are not an administrator, skip this step.

### To deploy the model version to the production environment

1. Log in to the CodePipeline console at <https://console.amazonaws.cn/codepipeline/>
2. Choose **Pipelines**, then choose the pipeline with the name **sagemaker-*projectname-projectid-modeldeploy***, where *projectname* is the name of your project, and *projectid* is the ID of your project.
3. In the **DeployStaging** stage, choose **Review**.

4. In the **Review** dialog box, choose **Approve**.

Approving the **DeployStaging** stage causes the MLOps system to deploy the model to production. To view the endpoint, choose the **Endpoints** tab on the project tab in SageMaker Studio.

## Step 6: Cleanup Resources

To stop incurring charges, clean up the resources that were created in this walkthrough. To do this, complete the following steps.

**Note**

To delete the Amazon CloudFormation stack and the Amazon S3 bucket, you need to be an administrator in SageMaker Studio. If you are not an administrator, ask your administrator to complete those steps.

1. From the SageMaker Studio menu, choose **File**, choose **New**, and then choose **Notebook**.
2. In the **Select Kernel** dialog box, choose **Python 3 (Data Science)**, then choose **Select**.
3. In the notebook, enter the following code in a cell, and then run the cell. Replace **MyProject** with the name of your project.

```
import boto3

sm_client=boto3.client("sagemaker")
sm_client.delete_project(ProjectName="MyProject")
```

This deletes the Service Catalog provisioned product that the project created. This includes the CodeCommit, CodePipeline, and CodeBuild resources that were created for the project.

4. Delete the Amazon CloudFormation stacks that the project created. There are 2 stacks, one for staging and one for production. The names of the stacks are **sagemaker-projectname-project-id-deploy-staging** and **sagemaker-projectname-project-id-deploy-prod**, where **projectname** is the name of your project, and **project-id** is the ID of your project.

For information about how to delete a Amazon CloudFormation stack, see [Deleting a stack on the Amazon CloudFormation console](#) in the *Amazon CloudFormation User Guide*.

5. Delete the Amazon S3 bucket that the project created. The name of the bucket is **sagemaker-project-project-id**, where **project-id** is the ID of your project.

## Amazon SageMaker ML Lineage Tracking

Amazon SageMaker ML Lineage Tracking creates and stores information about the steps of a machine learning (ML) workflow from data preparation to model deployment. With the tracking information you can reproduce the workflow steps, track model and dataset lineage, and establish model governance and audit standards.

With SageMaker Lineage Tracking data scientists and model builders can do the following:

- Keep a running history of model discovery experiments.
- Establish model governance by tracking model lineage artifacts for auditing and compliance verification.
- Clone and rerun workflows to experiment with what-if scenarios while developing models.
- Share a workflow that colleagues can reproduce and enhance (for example, while collaborating on solving a business problem).

- Clone and rerun workflows with additional debugging or logging routines, or new input variations for troubleshooting issues in production models.

#### Topics

- [Tracking Entities \(p. 2257\)](#)
- [Amazon SageMaker Created Tracking Entities \(p. 2258\)](#)
- [Manually Create Tracking Entities \(p. 2260\)](#)

## Tracking Entities

Tracking entities maintain a representation of all the elements of your end-to-end machine learning workflow. You can use this representation to establish model governance, reproduce your workflow, and maintain a record of your work history.

Amazon SageMaker automatically creates tracking entities for trial components and their associated trials and experiments when you create SageMaker jobs such as processing jobs, training jobs, and batch transform jobs. For more information, see [Manage Machine Learning with Amazon SageMaker Experiments \(p. 1553\)](#).

SageMaker also automatically creates tracking entities for the other steps in a workflow that enable you to track the workflow from end to end. For more information, see [Amazon SageMaker Created Tracking Entities \(p. 2258\)](#).

You can create additional entities to supplement those created by SageMaker. For more information, see [Manually Create Tracking Entities \(p. 2260\)](#).

SageMaker reuses any existing entities rather than create new ones. For example, there can be only one artifact with a unique `SourceUri`.

The following tracking entities are defined:

### Experiment entities

- **Trial component** – A stage of a machine learning trial. Includes processing jobs, training jobs, and batch transform jobs.
- **Trial** – A combination of trial components that generally produces a model.
- **Experiment** – A grouping of trials generally focused on solving a specific use case.

### Lineage entities

- **Context** – Provides a logical grouping of other tracking or experiment entities. Conceptually, experiments and trials are contexts. Some examples are an endpoint and a model package.
- **Action** – Represents an action or activity. Generally, an action involves at least one input artifact or output artifact. Some examples are a workflow step and a model deployment.
- **Artifact** – Represents a URI addressable object or data. An artifact is generally either an input or an output to a trial component or Action. Some examples include a dataset (Amazon S3 bucket URI), an image (Amazon ECR registry path), or an action (ARN).
- **Association** – Links other tracking or experiment entities. For example, an association between the location of training data and a training job.

An association has an optional `AssociationType` property. The following values are available along with the suggested use for each type. SageMaker places no restrictions on their use:

- **ContributedTo** – The source contributed to the destination or had a part in enabling the destination. For example, the training data contributed to the training job.

- **AssociatedWith** – The source is connected to the destination. For example, an approval workflow is associated with a model deployment.
- **DerivedFrom** - The destination is a modification of the source. For example, a digest output of a channel input for a processing job is derived from the original inputs.
- **Produced** – The source generated the destination. For example, a training job produced a model artifact.

### Common properties

- **Type property**

The action, artifact, and context entities have a `type` property, `ActionType`, `ArtifactType`, and `ContextType`, respectively. This property is a custom string which can associate meaningful information with the entity and be used as a filter in the List APIs.

- **Source property**

The action, artifact, and context entities have a `Source` property. This property provides the underlying URI that the entity represents. Some examples are:

- An `UpdateEndpoint` action where the source is the `EndpointArn`.
- An image artifact for a processing job where the source is the `ImageUri`.
- An Endpoint context where the source is the `EndpointArn`.

- **Metadata property**

The action and artifact entities have an optional `Metadata` property which can provide the following information:

- `ProjectId` – For example, the ID of the SageMaker MLOps project a model belongs to.
- `GeneratedBy` – For example, the SageMaker pipeline execution that registered a model package version.
- `Repository` – For example, the repository that contains an algorithm.
- `CommitId` – For example, the commit ID of an algorithm version.

## Amazon SageMaker Created Tracking Entities

Amazon SageMaker automatically creates tracking entities for SageMaker jobs, models, model packages, and endpoints if the data is available. There is no limit to the number of lineage entities automatically created by SageMaker.

For information on how you can manually create tracking entities, see [Manually Create Tracking Entities \(p. 2260\)](#).

### Topics

- [Tracking Entities for SageMaker Jobs \(p. 2258\)](#)
- [Tracking Entities for Model Packages \(p. 2259\)](#)
- [Tracking Entities for Endpoints \(p. 2259\)](#)

## Tracking Entities for SageMaker Jobs

A trial component is created for and associated with each SageMaker job. Artifacts are created to track the job metadata. Associations are created between each artifact and the job.

Artifacts are created for the following job properties and associated with the Amazon Resource Name (ARN) of the SageMaker job. The artifact `SourceUri` is listed in parentheses.

### Training Job

- The image that contains the training algorithm (`TrainingImage`)
- The data source of each input channel (`S3Uri`)
- The location for the model (`S3OutputPath`)
- The location for the managed spot checkpoint data (`s3uri`)

### Processing Job

- The container to be run by the processing job (`ImageUri`)
- The data location for each processing input and processing output (`s3uri`)

### Transform Job

- The input data source to be transformed (`S3Uri`)
- The results of the transform (`S3OutputPath`)

#### Note

Amazon Simple Storage Service (Amazon S3) artifacts are tracked based on the S3 URI values provided to the create API, for example [CreateTrainingJob](#), and not on the S3 key and hash/etag values from each file.

## Tracking Entities for Model Packages

The following entities are created:

### Model Packages

- A context for each model package group
- An artifact for each model package
- An association between each model package artifact and the context for each model package group the package belongs to
- An action for the creation of a model package version
- An association between the model package artifact and the creation action
- An association between the model package artifact and each model package group context the package belongs to
- Inference containers
  - An artifact for the image used in each container defined in the model package
  - An artifact for the model used in each container
  - An association between each artifact and the model package artifact
- Algorithms
  - An artifact for each algorithm defined in the model package
  - An artifact for the model created by each algorithm
  - An association between each artifact and the model package artifact

## Tracking Entities for Endpoints

The following entities are created:

## Endpoints

- A context for each endpoint
- An action for the model deployment that created each endpoint
- An artifact for each model deployed to the endpoint
- An artifact for the image used in the model
- An artifact for the model package for the model
- An artifact for each image deployed to the endpoint
- An association between each artifact and the model deployment action

## Manually Create Tracking Entities

You can manually create tracking entities for any property. For information on the tracking entities that Amazon SageMaker automatically creates, see [Amazon SageMaker Created Tracking Entities \(p. 2258\)](#).

You can add tags to all entities except associations. Tags are arbitrary key-value pairs that provide custom information. You can filter or sort a list or search query by tags. For more information, see [Tagging Amazon resources](#) in the *Amazon General Reference*.

For a sample notebook that demonstrates how to create lineage entities, see the [Amazon SageMaker Lineage](#) notebook in the [Amazon SageMaker example GitHub repository](#).

### Topics

- [Manually Create Entities \(p. 2260\)](#)
- [Manually Track a Workflow \(p. 2262\)](#)
- [Limits \(p. 2263\)](#)

## Manually Create Entities

The following procedure shows you how to create and associate artifacts between a SageMaker training job and endpoint. You perform the following steps:

- Create input artifacts for the source code, training data, and testing data locations.
- Create an output artifact for the generated model location.
- Create a trial component as a training job.
- Associate the input artifact and output artifacts with the training job.
- Train the model and create an endpoint.
- Create a context for the endpoint.
- Associate the training job and the endpoint context.

### To create tracking entities and associations

1. Import the tracking entities.

```
import sys
!{sys.executable} -m pip install -q sagemaker

from sagemaker import get_execution_role
from sagemaker.session import Session
from sagemaker.lineage import context, artifact, association, action
```

```
import boto3
boto_session = boto3.Session(region_name=region)
sagemaker_client = boto_session.client("sagemaker")
```

2. Create the input and output artifacts.

```
code_location_arn = artifact.Artifact.create(
    artifact_name='source-code-location',
    source_uri='s3://...',
    artifact_type='code-location'
).artifact_arn

# Similar constructs for train_data_location_arn and test_data_location_arn

model_location_arn = artifact.Artifact.create(
    artifact_name='model-location',
    source_uri='s3://...',
    artifact_type='model-location'
).artifact_arn
```

3. Train the model and get the trial\_component\_arn that represents the training job.
4. Associate the input artifacts and output artifacts with the training job (trial component).

```
input_artifacts = [code_location_arn, train_data_location_arn, test_data_location_arn]
for artifact_arn in input_artifacts:
    try:
        association.Association.create(
            source_arn=artifact_arn,
            destination_arn=trial_component_arn,
            association_type='ContributedTo'
        )
    except:
        logging.info('association between {} and {} already exists', artifact_arn,
                    trial_component_arn)

output_artifacts = [model_location_arn]
for artifact_arn in output_artifacts:
    try:
        association.Association.create(
            source_arn=trial_component_arn,
            destination_arn=artifact_arn,
            association_type='Produced'
        )
    except:
        logging.info('association between {} and {} already exists', artifact_arn,
                    trial_component_arn)
```

5. Create the inference endpoint.

```
predictor = mnist_estimator.deploy(initial_instance_count=1,
                                    instance_type='ml.m4.xlarge')
```

6. Create the endpoint context.

```
from sagemaker.lineage import context

endpoint = sagemaker_client.describe_endpoint(EndpointName=predictor.endpoint_name)
endpoint_arn = endpoint['EndpointArn']

endpoint_context_arn = context.Context.create(
    context_name=predictor.endpoint_name,
    context_type='Endpoint',
```

```
    source_uri=endpoint_arn
).context_arn
```

7. Associate the training job (trial component) and endpoint context.

```
association.Association.create(
    source_arn=trial_component_arn,
    destination_arn=endpoint_context_arn
)
```

## Manually Track a Workflow

You can manually track the workflow created in the previous section.

Given the endpoint Amazon Resource Name (ARN) from the previous example, the following procedure shows you how to track the workflow back to the datasets used to train the model that was deployed to the endpoint. You perform the following steps:

- Given the endpoint ARN, get the endpoint context.
- Get the trial component from the association between the trial component and the endpoint context.
- Get the training data location artifact from the association between the trial component and the endpoint context.
- Get the training data location from the training data location artifact.

### To track a workflow from endpoint to training data source

1. Import the tracking entities.

```
import sys
!{sys.executable} -m pip install -q sagemaker

from sagemaker import get_execution_role
from sagemaker.session import Session
from sagemaker.lineage import context, artifact, association, action

import boto3
boto_session = boto3.Session(region_name=region)
sagemaker_client = boto_session.client("sagemaker")
```

2. Get the endpoint context from the endpoint ARN.

```
endpoint_context_arn = sagemaker_client.list_contexts(
    SourceUri=endpoint_arn)[ 'ContextSummaries' ][0][ 'ContextArn' ]
```

3. Get the trial component from the association between the trial component and the endpoint context.

```
trial_component_arn = sagemaker_client.list_associations(
    DestinationArn=endpoint_context_arn)[ 'AssociationSummaries' ][0][ 'SourceArn' ]
```

4. Get the training data location artifact from the association between the trial component and the endpoint context.

```
train_data_location_artifact_arn = sagemaker_client.list_associations(
    DestinationArn=trial_component_arn, SourceType='Model')[ 'AssociationSummaries' ][0]
[ 'SourceArn' ]
```

5. Get the training data location from the training data location artifact.

```
train_data_location = sagemaker_client.describe_artifact(  
    ArtifactArn=train_data_location_artifact_arn)['Source']['SourceUri']  
print(train_data_location)
```

Response:

```
s3://sagemaker-sample-data-us-east-2/mxnet/mnist/train
```

## Limits

An association can be created between any entities, experiment and lineage, except the following:

- An association can't be created between two experiment entities. Experiment entities consist of experiments, trials, and trial components.
- An association can't be created with another association.

An error occurs if you try to create an entity that already exists.

### Maximum number of manually created lineage entities

- Actions: 3000
- Artifacts: 6000
- Associations: 6000
- Contexts: 500

There is no limit to the number of lineage entities automatically created by SageMaker.

## Kubernetes Orchestration

You can orchestrate your SageMaker training and inference jobs with SageMaker Operators for Kubernetes and SageMaker Components for Kubeflow Pipelines. SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. SageMaker Components for Kubeflow Pipelines allow you to move your data processing and training jobs from the Kubernetes cluster to SageMaker's machine learning-optimized managed service.

### Contents

- [SageMaker Operators for Kubernetes \(p. 2263\)](#)
- [SageMaker Components for Kubeflow Pipelines \(p. 2294\)](#)

## SageMaker Operators for Kubernetes

SageMaker Operators for Kubernetes make it easier for developers and data scientists using Kubernetes to train, tune, and deploy machine learning (ML) models in SageMaker. You can install these SageMaker Operators on your Kubernetes cluster in Amazon Elastic Kubernetes Service (Amazon EKS) to create SageMaker jobs natively using the Kubernetes API and command-line Kubernetes tools such as kubectl.

This guide shows you how to set up the operators. The guide also explains how to use the operators to run model training, hyperparameter tuning, and inference (real-time and batch).

There is no additional charge to use these operators. You do incur charges for any SageMaker resources that you use through these operators. The procedures and guidelines here assume you are familiar with Kubernetes and its basic commands.

## Contents

- [What is an operator? \(p. 2264\)](#)
- [IAM role-based setup and operator deployment \(p. 2265\)](#)
- [Delete operators \(p. 2274\)](#)

- [Images and SMlogs in each Region \(p. 2276\)](#)
- [Using SageMaker Jobs \(p. 2277\)](#)

## What is an operator?

Kubernetes is built on top of what is called the *controller pattern*. This pattern allows applications and tools to listen to a central state manager (ETCD) and act when something happens. Examples of such applications include `cloud-controller-manager` and `controller-manager`. The controller pattern allows you to create decoupled experiences and not have to worry about how other components are integrated. To add new capabilities to Kubernetes, developers can extend the Kubernetes API by creating a custom resource that contains their application-specific or domain-specific logic and components. Operators in Kubernetes allow users to natively invoke these custom resources and automate associated workflows.

## Prerequisites

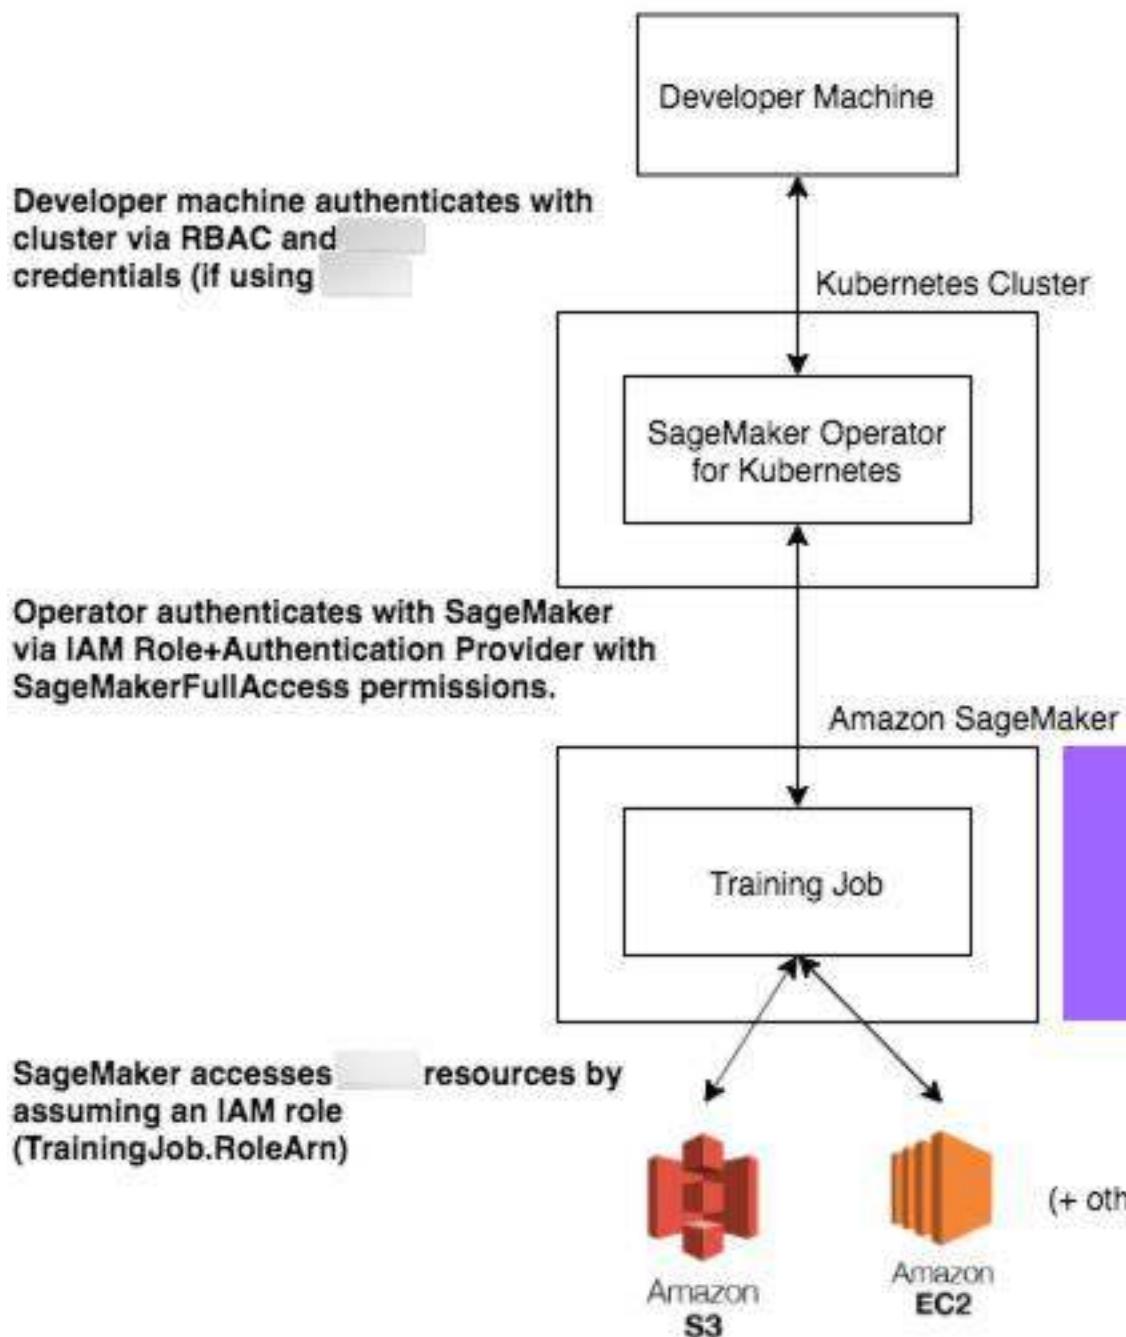

This guide assumes that you've completed the following prerequisites:

- Installed the following tools on the client machine used to access your Kubernetes cluster:
  - `kubectl` Version 1.13 or later. Use a `kubectl` version that is within one minor version of your Amazon EKS cluster control plane. For example, a 1.13 `kubectl` client works with Kubernetes 1.13 and 1.14 clusters. OpenID Connect (OIDC) is not supported in versions earlier than 1.13.
  - `eksctl` Version 0.7.0 or later
  - [Amazon CLI](#) Version 1.16.232 or later
  - (optional) [Helm](#) Version 3.0 or later
  - [aws-iam-authenticator](#)
- Have IAM permissions to create roles and attach policies to roles.
- Created a Kubernetes cluster on which to run the operators. It should either be Kubernetes version 1.13 or 1.14. For automated cluster creation using `eksctl`, see [Getting Started with eksctl](#). It takes 20 to 30 minutes to provision a cluster.

## Permissions overview

The SageMaker Operators for Kubernetes allow you to manage jobs in SageMaker from your Kubernetes cluster. The operators access SageMaker resources on your behalf. The IAM role that the operator assumes to interact with Amazon resources differs from the credentials you use to access the Kubernetes cluster. The role also differs from the role that SageMaker assumes when running your machine learning jobs. The following image explains this design and flow.

## Authentication Layers in the SageMaker Operator for Kubernetes

### IAM role-based setup and operator deployment

The following sections describe the steps to set up and deploy the operator.

## Cluster-scoped deployment

Before you can deploy your operator using an IAM role, associate an OpenID Connect (OIDC) provider with your role to authenticate with the IAM service.

### Create an OpenID Connect Provider for Your Cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local CLUSTER\_NAME and AWS\_REGION environment variables as follows:

```
# Set the Region and cluster
export CLUSTER_NAME="<your cluster name>"
export Amazon_REGION="<your region>"
```

2. Use the following command to associate the OIDC provider with your cluster. For more information, see [Enabling IAM Roles for Service Accounts on your Cluster](#).

```
eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
--region ${AWS_REGION} --approve
```

Your output should look like the following:

```
[__] eksctl version 0.10.1
[__] using region us-east-1
[__] IAM OpenID Connect provider is associated with cluster "my-cluster" in "us-east-1"
```

Now that the cluster has an OIDC identity provider, you can create a role and give a Kubernetes ServiceAccount permission to assume the role.

### Get the OIDC ID

To set up the ServiceAccount, obtain the OpenID Connect issuer URL using the following command:

```
aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} \
--query cluster.identity.oidc.issuer --output text
```

The command returns a URL like the following:

```
https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

In this URL, the value D48675832CA65BD10A532F597OIDCID is the OIDC ID. The OIDC ID for your cluster is different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

```
aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC
```

The OIDC URL is returned as follows:

```
OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

## Create an IAM Role

1. Create a file named `trust.json` and insert the following trust relationship code block into it instead. Be sure to replace all `<OIDC ID>`, `<Amazon account number>`, and `<EKS Cluster region>` placeholders with values corresponding to your cluster.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Federated": "arn:aws-cn:iam::<Amazon account number>:oidc-provider/
oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
            },
            "Action": "sts:AssumeRoleWithWebIdentity",
            "Condition": {
                "StringEquals": {
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:sub": "system:serviceaccount:sagemaker-k8s-operator-system:sagemaker-k8s-operator-default"
                }
            }
        }
    ]
}
```

2. Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

```
aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-
policy-document file://trust.json --output=text
```

Your output should look like the following:

```
ROLE      arn:aws:iam::123456789012:role/my-role 2019-11-22T21:46:10Z      /
  ABCDEF0DNN7EXAMPLE      my-role
ASSUMEROLEPOLICYDOCUMENT      2012-10-17
STATEMENT      sts:AssumeRoleWithWebIdentity      Allow
STRINGEQUALS      sts.amazonaws.com      system:serviceaccount:sagemaker-k8s-operator-
system:sagemaker-k8s-operator-default
PRINCIPAL      arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-
east-1.amazonaws.com/id/
```

Take note of `ROLE ARN`; you pass this value to your operator.

## Attach the `AmazonSageMakerFullAccess` Policy to the Role

To give the role access to SageMaker, attach the `AmazonSageMakerFullAccess` policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

Attach the following policy:

```
aws iam attach-role-policy --region ${AWS_REGION} --role-name <role name> --policy-arn
arn:aws-cn:iam::aws:policy/AmazonSageMakerFullAccess
```

The Kubernetes ServiceAccount `sagemaker-k8s-operator-default` should have `AmazonSageMakerFullAccess` permissions. Confirm this when you install the operator.

## Deploy the Operator

When deploying your operator, you can use either a YAML file or Helm charts.

### Deploy the Operator Using YAML

This is the simplest way to deploy your operators. The process is as follows:

1. Download the following installer script. Whenever `installer.yaml` is referenced, use `installer_china.yaml` instead.

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/release/rolebased/china/installer_china.yaml
```

2. Edit the `installer.yaml` file to replace `eks.amazonaws.com/role-arn`. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.
3. Use the following command to deploy the cluster:

```
kubectl apply -f installer.yaml
```

### Deploy the Operator Using Helm Charts

Use the provided Helm Chart to install the operator.

1. Clone the Helm installer directory using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.
3. Install the Helm Chart using the following command:

```
kubectl create namespace sagemaker-k8s-operator-system
helm install --namespace sagemaker-k8s-operator-system sagemaker-operator rolebased/
```

If you decide to install the operator into a namespace other than the one specified, you need to adjust the namespace defined in the IAM role `trust.json` file to match.

4. After a moment, the chart is installed with a randomly generated name. Verify that the installation succeeded by running the following command:

```
helm ls
```

Your output should look like the following:

NAME	NAMESPACE	STATUS	CHART	REVISION	UPDATED	APP VERSION
sagemaker-operator	sagemaker-k8s-operator-system	23:14:59.6777082 +0000 UTC	deployed	1	2019-11-20	sagemaker-k8s-operator-0.1.0

### Verify the operator deployment

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```
kubectl get crd | grep sagemaker
```

Your output should look like the following:

batchtransformjobs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
endpointconfigs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
hostingdeployments.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
hyperparametertuningjobs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
models.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
trainingjobs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```
kubectl -n sagemaker-k8s-operator-system get pods
```

You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `sagemaker-k8s-operator-system` as follows:

NAME	READY	STATUS	RESTARTS
AGE			
sagemaker-k8s-operator-controller-manager-12345678-r8abc	2/2	Running	0
23s			

## Namespace-scoped deployment

You have the option to install your operator within the scope of an individual Kubernetes namespace. In this mode, the controller only monitors and reconciles resources with SageMaker if the resources are created within that namespace. This allows for finer-grained control over which controller is managing which resources. This is useful for deploying to multiple Amazon accounts or controlling which users have access to particular jobs.

This guide outlines how to install an operator into a particular, predefined namespace. To deploy a controller into a second namespace, follow the guide from beginning to end and change out the namespace in each step.

### Create an OpenID Connect Provider for Your Amazon EKS cluster

The following instructions show how to create and associate an OIDC provider with your Amazon EKS cluster.

1. Set the local `CLUSTER_NAME` and `AWS_REGION` environment variables as follows:

```
# Set the region and cluster
export CLUSTER_NAME="<your cluster name>"
export Amazon_REGION="<your region>"
```

2. Use the following command to associate the OIDC provider with your cluster. For more information, see [Enabling IAM Roles for Service Accounts on your Cluster](#).

```
eksctl utils associate-iam-oidc-provider --cluster ${CLUSTER_NAME} \
--region ${AWS_REGION} --approve
```

Your output should look like the following:

```
[__] eksctl version 0.10.1
```

```
[_] using region us-east-1
[_] IAM OpenID Connect provider is associated with cluster "my-cluster" in "us-east-1"
```

Now that the cluster has an OIDC identity provider, create a role and give a Kubernetes ServiceAccount permission to assume the role.

### [Get your OIDC ID](#)

To set up the ServiceAccount, first obtain the OpenID Connect issuer URL using the following command:

```
aws eks describe-cluster --name ${CLUSTER_NAME} --region ${AWS_REGION} \
--query cluster.identity.oidc.issuer --output text
```

The command returns a URL like the following:

```
https://oidc.eks.${AWS_REGION}.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

In this URL, the value D48675832CA65BD10A532F597OIDCID is the OIDC ID. The OIDC ID for your cluster will be different. You need this OIDC ID value to create a role.

If your output is None, it means that your client version is old. To work around this, run the following command:

```
aws eks describe-cluster --region ${AWS_REGION} --query cluster --name ${CLUSTER_NAME} --output text | grep OIDC
```

The OIDC URL is returned as follows:

```
OIDC https://oidc.eks.us-east-1.amazonaws.com/id/D48675832CA65BD10A532F597OIDCID
```

### [Create your IAM Role](#)

1. Create a file named `trust.json` and insert the following trust relationship code block into it instead. Be sure to replace all <OIDC ID>, <Amazon account number>, and <EKS Cluster region> placeholders with values corresponding to your cluster.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Federated": "arn:aws-cn:iam::<Amazon account number>:oidc-provider/
oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>"
            },
            "Action": "sts:AssumeRoleWithWebIdentity",
            "Condition": {
                "StringEquals": {
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:aud": "sts.amazonaws.com",
                    "oidc.eks.<EKS Cluster region>.amazonaws.com/id/<OIDC ID>:sub": "system:serviceaccount:<Namespace>:sagemaker-k8s-operator-default"
                }
            }
        ]
    ]
}
```

- Run the following command to create a role with the trust relationship defined in `trust.json`. This role enables the Amazon EKS cluster to get and refresh credentials from IAM.

```
aws iam create-role --region ${AWS_REGION} --role-name <role name> --assume-role-policy-document file://trust.json --output=text
```

Your output should look like the following:

```
ROLE      arn:aws:iam::123456789012:role/my-role 2019-11-22T21:46:10Z      /
  ABCDEFSFODNN7EXAMPLE      my-role
ASSUMEROLEPOLICYDOCUMENT      2012-10-17
STATEMENT      sts:AssumeRoleWithWebIdentity      Allow
STRINGEQUALS      sts.amazonaws.com      system:serviceaccount:my-namespace:sagemaker-
k8s-operator-default
PRINCIPAL      arn:aws:iam::123456789012:oidc-provider/oidc.eks.us-
east-1.amazonaws.com/id/
```

Take note of `ROLE ARN`. You pass this value to your operator.

### Attach the `AmazonSageMakerFullAccess` Policy to your Role

To give the role access to SageMaker, attach the [AmazonSageMakerFullAccess](#) policy. If you want to limit permissions to the operator, you can create your own custom policy and attach it.

Attach the following policy:

```
aws iam attach-role-policy --region ${AWS_REGION} --role-name <role name> --policy-arn
arn:aws-cn:iam::aws:policy/AmazonSageMakerFullAccess
```

The Kubernetes ServiceAccount `sagemaker-k8s-operator-default` should have `AmazonSageMakerFullAccess` permissions. Confirm this when you install the operator.

### Deploy the Operator to Your Namespace

When deploying your operator, you can use either a YAML file or Helm charts.

#### Deploy the Operator to Your Namespace Using YAML

There are two parts to deploying an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself.

If you have not already installed the CRDs into the cluster, apply the CRD installer YAML using the following command:

```
kubectl apply -f https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/
master/release/rolebased/namespaced/crd.yaml
```

To install the operator onto the cluster:

- Download the following operator script. Whenever `operator.yaml` is referenced, use `operator_china.yaml` instead.

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/
release/rolebased/namespaced/china/operator_china.yaml
```

- Update the installer YAML to place the resources into your specified namespace using the following command:

```
sed -i -e 's/PLACEHOLDER-NAMESPACE/<YOUR NAMESPACE>/g' operator.yaml
```

3. Edit the `operator.yaml` file to place resources into your `eks.amazonaws.com/role-arn`. Replace the ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.
4. Use the following command to deploy the cluster:

```
kubectl apply -f operator.yaml
```

## Deploy the Operator to Your Namespace Using Helm Charts

There are two parts needed to deploy an operator within the scope of a namespace. The first is the set of CRDs that are installed at a cluster level. These resource definitions only need to be installed once per Kubernetes cluster. The second part is the operator permissions and deployment itself. When using helm charts you have to first create the namespace using `kubectl`.

1. Clone the Helm installer directory using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/installer/namespaced` folder. Edit the `rolebased/values.yaml` file, which includes high-level parameters for the chart. Replace the role ARN here with the Amazon Resource Name (ARN) for the OIDC-based role you've created.
3. Install the Helm Chart using the following command:

```
helm install crds crd_chart/
```

4. Create the required namespace and install the operator using the following command:

```
kubectl create namespace <namespace>
helm install --n <namespace> op operator_chart/
```

5. After a moment, the chart is installed with the name `sagemaker-operator`. Verify that the installation succeeded by running the following command:

```
helm ls
```

Your output should look like the following:

NAME	NAMESPACE	STATUS	CHART	REVISION	UPDATED
					APP VERSION
sagemaker-operator	my-namespace			1	2019-11-20
23:14:59.6777082 +0000 UTC	deployed				sagemaker-k8s-operator-0.1.0

## Verify the operator deployment to your namespace

1. You should be able to see the SageMaker Custom Resource Definitions (CRDs) for each operator deployed to your cluster by running the following command:

```
kubectl get crd | grep sagemaker
```

Your output should look like the following:

batchtransformjobs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
endpointconfigs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
hostingdeployments.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
hyperparametertuningjobs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
models.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z
trainingjobs.sagemaker.aws.amazon.com	2019-11-20T17:12:34Z

2. Ensure that the operator pod is running successfully. Use the following command to list all pods:

```
kubectl -n my-namespace get pods
```

You should see a pod named `sagemaker-k8s-operator-controller-manager-*****` in the namespace `my-namespace` as follows:

NAME	READY	STATUS	RESTARTS
AGE sagemaker-k8s-operator-controller-manager-12345678-r8abc 23s	2/2	Running	0

## Install the SageMaker logs `kubectl` plugin

As part of the SageMaker Operators for Kubernetes, you can use the [smlogs plugin](#) for `kubectl`. This enables SageMaker CloudWatch logs to be streamed with `kubectl`. `kubectl` must be installed onto your [PATH](#). The following commands place the binary in the `sagemaker-k8s-bin` directory in your home directory, and add that directory to your [PATH](#).

```
export os="linux"

wget https://amazon-sagemaker-operator-for-k8s-us-east-1.s3.amazonaws.com/kubectl-smlogs-
plugin/v1/${os}.amd64.tar.gz
tar xvzf ${os}.amd64.tar.gz

# Move binaries to a directory in your homedir.
mkdir ~/.sagemaker-k8s-bin
cp ./kubectl-smlogs.${os}.amd64/kubectl-smlogs ~/.sagemaker-k8s-bin/.

# This line adds the binaries to your PATH in your .bashrc.

echo 'export PATH=$PATH:~/sagemaker-k8s-bin' >> ~/.bashrc

# Source your .bashrc to update environment variables:
source ~/.bashrc
```

Use the following command to verify that the `kubectl` plugin is installed correctly:

```
kubectl smlogs
```

If the `kubectl` plugin is installed correctly, your output should look like the following:

```
View SageMaker logs via Kubernetes

Usage:
  smlogs [command]
```

```
Aliases:  
  smlogs, SMLogs, Smlogs  
  
Available Commands:  
  BatchTransformJob      View BatchTransformJob logs via Kubernetes  
  TrainingJob           View TrainingJob logs via Kubernetes  
  help                  Help about any command  
  
Flags:  
  -h, --help    help for smlogs  
  
Use "smlogs [command] --help" for more information about a command.
```

## Delete operators

### Delete cluster-based operators

#### Operators installed using YAML

To uninstall the operator from your cluster, make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang. Once you have deleted all SageMaker jobs, use `kubectl` to delete the operator from the cluster. Run the following commands to stop all jobs and delete the operator from the cluster:

```
# Delete all SageMaker jobs from Kubernetes  
kubectl delete --all --all-namespaces hyperparametertuningjob.sagemaker.aws.amazon.com  
kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com  
kubectl delete --all --all-namespaces batchtransformjob.sagemaker.aws.amazon.com  
kubectl delete --all --all-namespaces hostingdeployment.sagemaker.aws.amazon.com  
  
# Delete the operator and its resources  
kubectl delete -f /installer.yaml
```

You should see output like the following:

```
$ kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com  
trainingjobs.sagemaker.aws.amazon.com "xgboost-mnist-from-for-s3" deleted  
  
$ kubectl delete --all --all-namespaces hyperparametertuningjob.sagemaker.aws.amazon.com  
hyperparametertuningjob.sagemaker.aws.amazon.com "xgboost-mnist-hpo" deleted  
  
$ kubectl delete --all --all-namespaces batchtransformjob.sagemaker.aws.amazon.com  
batchtransformjob.sagemaker.aws.amazon.com "xgboost-mnist" deleted  
  
$ kubectl delete --all --all-namespaces hostingdeployment.sagemaker.aws.amazon.com  
hostingdeployment.sagemaker.aws.amazon.com "host-xgboost" deleted  
  
$ kubectl delete -f raw-yaml/installer.yaml  
namespace "sagemaker-k8s-operator-system" deleted  
customresourcedefinition.apiextensions.k8s.io "batchtransformjobs.sagemaker.aws.amazon.com"  
  deleted  
customresourcedefinition.apiextensions.k8s.io "endpointconfigs.sagemaker.aws.amazon.com"  
  deleted  
customresourcedefinition.apiextensions.k8s.io "hostingdeployments.sagemaker.aws.amazon.com"  
  deleted  
customresourcedefinition.apiextensions.k8s.io  
  "hyperparametertuningjobs.sagemaker.aws.amazon.com" deleted  
customresourcedefinition.apiextensions.k8s.io "models.sagemaker.aws.amazon.com" deleted  
customresourcedefinition.apiextensions.k8s.io "trainingjobs.sagemaker.aws.amazon.com"  
  deleted  
role.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-role" deleted
```

```

clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-role" deleted
clusterrole.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-role" deleted
rolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-leader-election-rolebinding"
    deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-manager-rolebinding"
    deleted
clusterrolebinding.rbac.authorization.k8s.io "sagemaker-k8s-operator-proxy-rolebinding"
    deleted
service "sagemaker-k8s-operator-controller-metrics-service" deleted
deployment.apps "sagemaker-k8s-operator-controller-manager" deleted
secrets "sagemaker-k8s-operator-abcde" deleted

```

## Operators installed using Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```

# get the helm charts
$ helm ls

# delete the charts
$ helm delete <chart name>

```

## Delete namespace-based operators

### Operators installed with YAML

To uninstall the operator from your cluster, make sure that all SageMaker resources have been deleted from the cluster. Failure to do so causes the operator delete operation to hang. Once you have deleted all SageMaker jobs, use kubectl to first delete the operator from the namespace and then the CRDs from the cluster. Run the following commands to stop all jobs and delete the operator from the cluster:

```

# Delete all SageMaker jobs from Kubernetes
kubectl delete --all --all-namespaces hyperparametertuningjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces trainingjobs.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces batchtransformjob.sagemaker.aws.amazon.com
kubectl delete --all --all-namespaces hostingdeployment.sagemaker.aws.amazon.com

```

```

# Delete the operator using the same yaml file that was used to install the operator
kubectl delete -f operator.yaml

# Now delete the CRDs using the CRD installer yaml
kubectl delete -f https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/
master/release/rolebased/namespaced/crd.yaml

# Now you can delete the namespace if you want
kubectl delete namespace <namespace>

```

### Operators installed with Helm Charts

To delete the operator CRDs, first delete all the running jobs. Then delete the Helm Chart that was used to deploy the operators using the following commands:

```

# Delete the operator
$ helm delete -n <namespace> op

# delete the crds
$ helm delete crds

```

```
# optionally delete the namespace
$ kubectl delete namespace <namespace>
```

## Troubleshooting

### Debugging a Failed Job

- Check the job status by running the following:

```
kubectl get <CRD Type> <job name>
```

- If the job was created in SageMaker, you can use the following command to see the STATUS and the SageMaker Job Name:

```
kubectl get <crd type> <job name>
```

- You can use smlogs to find the cause of the issue using the following command:

```
kubectl smlogs <crd type> <job name>
```

- You can also use the describe command to get more details about the job using the following command. The output has an additional field that has more information about the status of the job.

```
kubectl describe <crd type> <job name>
```

- If the job was not created in SageMaker, then use the logs of the operator's pod to find the cause of the issue as follows:

```
$ kubectl get pods -A | grep sagemaker
# Output:
sagemaker-k8s-operator-system    sagemaker-k8s-operator-controller-manager-5cd7df4d74-
wh22z    2/2      Running     0          3h33m

$ kubectl logs -p <pod name> -c manager -n sagemaker-k8s-operator-system
```

### Deleting an Operator CRD

If deleting a job is not working, check if the operator is running. If the operator is not running, then you have to delete the finalizer using the following steps:

1. In a new terminal, open the job in an editor using `kubectl edit` as follows:

```
$ kubectl edit <crd type> <job name>
```

2. Edit the job to delete the finalizer by removing the following two lines from the file. Save the file and the job is be deleted.

```
finalizers:
- sagemaker-operator-finalizer
```

## Images and SMlogs in each Region

The following table lists the available operator images and SMLogs in each region.

Region	Controller Image	Linux SMLogs
us-east-1	957583890962.dkr.ecr.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1	<a href="https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.us-east-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a>
us-east-2	922499468684.dkr.ecr.us-east-2.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1	<a href="https://s3.us-east-2.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-2/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.us-east-2.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-east-2/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a>
us-west-2	640106867763.dkr.ecr.us-west-2.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1	<a href="https://s3.us-west-2.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-west-2/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.us-west-2.amazonaws.com/amazon-sagemaker-operator-for-k8s-us-west-2/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a>
eu-west-1	613661167059.dkr.ecr.eu-west-1.amazonaws.com/amazon-sagemaker-operator-for-k8s:v1	<a href="https://s3.eu-west-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-eu-west-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz">https://s3.eu-west-1.amazonaws.com/amazon-sagemaker-operator-for-k8s-eu-west-1/kubectl-smlogs-plugin/v1/linux.amd64.tar.gz</a>

## Using SageMaker Jobs

To run a job using the SageMaker Operators for Kubernetes, you can either apply a YAML file or use the supplied Helm Charts.

All operator sample jobs in the following tutorials use sample data taken from a public MNIST dataset. In order to run these samples, download the dataset into your Amazon S3 bucket. You can find the dataset in [Download the MNIST Dataset](#).

### Contents

- [TrainingJob operator \(p. 2277\)](#)
- [HyperParameterTuningJobs operator \(p. 2281\)](#)
- [BatchTransformJobs operator \(p. 2286\)](#)
- [Real-time inference \(p. 674\)](#)

## TrainingJob operator

Training job operators reconcile your specified training job spec to SageMaker by launching it for you in SageMaker. You can learn more about SageMaker training jobs in the SageMaker [CreateTrainingJob API documentation](#).

### Create a TrainingJob Using a Simple YAML File

1. Download the sample YAML file for training using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/
samples/xgboost-mnist-trainingjob.yaml
```

2. Edit the `xgboost-mnist-trainingjob.yaml` file to replace the `roleArn` parameter with your `<sagemaker-execution-role>`, and `outputPath` with your Amazon S3 bucket that the SageMaker execution role has write access to. The `roleArn` must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see [SageMaker Roles](#). Apply the YAML file using the following command:

```
kubectl apply -f xgboost-mnist-trainingjob.yaml
```

## Create a TrainingJob Using a Helm Chart

You can use Helm Charts to run TrainingJobs.

1. Clone the GitHub repo to get the source using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/training-jobs/` folder and edit the `values.yaml` file to replace values like `rolearn` and `outputpath` with values that correspond to your account. The RoleARN must have permissions so that SageMaker can access Amazon S3, Amazon CloudWatch, and other services on your behalf. For more information on creating an SageMaker ExecutionRole, see [SageMaker Roles](#).

## Create the Training Job

With the roles and Amazon S3 buckets replaced with appropriate values in `values.yaml`, you can create a training job using the following command:

```
helm install . --generate-name
```

Your output should look like the following:

```
NAME: chart-12345678
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-trainingjob.
```

## Verify Your Training Helm Chart

To verify that the Helm Chart was created successfully, run:

```
helm ls
```

Your output should look like the following:

NAME	STATUS	NAMESPACE	REVISION	UPDATED	APP VERSION
		CHART			
chart-12345678	deployed	default	1	2019-11-20 23:35:49.9136092 +0000 UTC	sagemaker-k8s-trainingjob-0.1.0
rolebased-12345678	deployed	default	1	2019-11-20 23:14:59.6777082 +0000 UTC	sagemaker-k8s-operator-0.1.0

`helm install` creates a TrainingJob Kubernetes resource. The operator launches the actual training job in SageMaker and updates the TrainingJob Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running training job. You cannot edit any parameter and re-apply the file/config. Either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

## List Training Jobs

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get TrainingJob
```

The output listing all jobs should look like the following:

```
kubectl get trainingjobs
NAME           STATUS    SECONDARY-STATUS   CREATION-TIME
SAGEMAKER-JOB-NAME
xgboost-mnist-from-for-s3   InProgress   Starting          2019-11-20T23:42:35Z   xgboost-
mnist-from-for-s3-examplef11eab94e0ed4671d5a8f
```

A training job continues to be listed after the job has completed or failed. You can remove a `TrainingJob` job from the list by following the Delete a Training Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

### Training Job Status Values

The `STATUS` field can be one of the following values:

- `Completed`
- `InProgress`
- `Failed`
- `Stopped`
- `Stopping`

These statuses come directly from the SageMaker official [API documentation](#).

In addition to the official SageMaker status, it is possible for `STATUS` to be `SynchronizingK8sJobWithSageMaker`. This means that the operator has not yet processed the job.

### Secondary Status Values

The secondary statuses come directly from the SageMaker official [API documentation](#). They contain more granular information about the status of the job.

### Describe a Training Job

You can get more details about the training job by using the `describe kubectl` verb. This is typically used for debugging a problem or checking the parameters of a training job. To get information about your training job, use the following command:

```
kubectl describe trainingjob xgboost-mnist-from-for-s3
```

The output for your training job should look like the following:

```
Name:           xgboost-mnist-from-for-s3
Namespace:      default
Labels:         <none>
Annotations:   <none>
API Version:  sagemaker.aws.amazon.com/v1
Kind:          TrainingJob
Metadata:
  Creation Timestamp: 2019-11-20T23:42:35Z
Finalizers:
```

```

## View Logs from Training Jobs

Use the following command to see the logs from the kmeans-mnist training job:

```
kubectl smlogs trainingjob xgboost-mnist-from-for-s3
```

Your output should look similar to the following. The logs from instances are ordered chronologically.

```
"xgboost-mnist-from-for-s3" has SageMaker TrainingJobName "xgboost-mnist-from-for-s3-123456789" in region "us-east-2", status "InProgress" and secondary status "Starting" 23:45:24.7 +0000 UTC Arguments: train xgboost-mnist-from-for-s3-6d7fa0af0bef11eab94e0ed46example/algo-1-1574293123 2019-11-20 23:45:24.7 +0000 UTC [2019-11-20:23:45:22:INFO] Running standalone xgboost training. xgboost-mnist-from-for-s3-6d7fa0af0bef11eab94e0ed46example/algo-1-1574293123 2019-11-20 23:45:24.7 +0000 UTC [2019-11-20:23:45:22:INFO] File size need to be processed in the node: 1122.95mb. ```

## Delete Training Jobs

Use the following command to stop a training job on Amazon SageMaker:

```
kubectl delete trainingjob xgboost-mnist-from-for-s3
```

This command removes the SageMaker training job from Kubernetes. This command returns the following output:

```
trainingjob.sagemaker.aws.amazon.com "xgboost-mnist-from-for-s3" deleted
```

If the job is still in progress on SageMaker, the job stops. You do not incur any charges for SageMaker resources after your job stops or completes.

**Note:** SageMaker does not delete training jobs. Stopped jobs continue to show on the SageMaker console. The delete command takes about 2 minutes to clean up the resources from SageMaker.

## HyperParameterTuningJobs operator

Hyperparameter tuning job operators reconcile your specified hyperparameter tuning job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker hyperparameter tuning jobs in the SageMaker [CreateHyperParameterTuningJob API documentation](#).

### Create a Hyperparameter Tuning Job Using a Simple YAML File

1. Download the sample YAML file for the hyperparameter tuning job using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hpo.yaml
```

2. Edit the `xgboost-mnist-hpo.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account. Apply the updates YAML file using the following command:

```
kubectl apply -f xgboost-mnist-hpo.yaml
```

## Create a Hyperparameter Tuning Job using a Helm Chart

You can use Helm Charts to run hyperparameter tuning jobs.

1. Clone the GitHub repo to get the source using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

2. Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/hyperparameter-tuning-jobs/` folder.
3. Edit the `values.yaml` file to replace the `roleArn` parameter with your `sagemaker-execution-role`. For the hyperparameter tuning job to succeed, you must also change the `s3InputPath` and `s3OutputPath` to values that correspond to your account.

## Create the Hyperparameter Tuning Job

With the roles and Amazon S3 paths replaced with appropriate values in `values.yaml`, you can create a hyperparameter tuning job using the following command:

```
helm install . --generate-name
```

Your output should look similar to the following:

```
NAME: chart-1574292948
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-hyperparametertuningjob.
```

## Verify Chart Installation

To verify that the Helm Chart was created successfully, run the following command:

```
helm ls
```

Your output should look like the following:

NAME	NAMESPACE	REVISION	UPDATED
chart-1474292948	default	1	2019-11-20 23:35:49.9136092 +0000
UTC deployed	sagemaker-k8s-hyperparametertuningjob-0.1.0		
STATUS	CHART		APP VERSION
chart-1574292948	default	1	2019-11-20 23:35:49.9136092 +0000
UTC deployed	sagemaker-k8s-trainingjob-0.1.0		
rolebased-1574291698	default	1	2019-11-20 23:14:59.6777082 +0000
UTC deployed	sagemaker-k8s-operator-0.1.0		

`helm install` creates a `HyperParameterTuningJob` Kubernetes resource. The operator launches the actual hyperparameter optimization job in SageMaker and updates the `HyperParameterTuningJob`

Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running hyperparameter tuning job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like TFJob in Kubeflow, update is not supported.

## List Hyperparameter Tuning Jobs

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get hyperparametertuningjob
```

Your output should look like the following:

NAME	STATUS	CREATION-TIME	COMPLETED	INPROGRESS	ERRORS	STOPPED
SAGEMAKER-JOB-NAME						
BEST-TRAINING-JOB	Completed	2019-10-17T01:15:52Z	10	0	0	0
xgboost-mnist-hpo		xgboosttha92f5e3cf07b11e9bf6c06d6-009-4c7a123		xgboosttha92f5e3cf07b11e9bf6c123		

A hyperparameter tuning job continues to be listed after the job has completed or failed. You can remove a hyperparametertuningjob from the list by following the steps in [Delete a Hyperparameter Tuning Job](#). Jobs that have completed or stopped do not incur any charges for SageMaker resources.

## Hyperparameter Tuning Job Status Values

The STATUS field can be one of the following values:

- Completed
- InProgress
- Failed
- Stopped
- Stopping

These statuses come directly from the SageMaker official [API documentation](#).

In addition to the official SageMaker status, it is possible for STATUS to be SynchronizingK8sJobWithSageMaker. This means that the operator has not yet processed the job.

## Status Counters

The output has several counters, like COMPLETED and INPROGRESS. These represent how many training jobs have completed and are in progress, respectively. For more information about how these are determined, see [TrainingJobStatusCounters](#) in the SageMaker API documentation.

## Best Training Job

This column contains the name of the TrainingJob that best optimized the selected metric.

To see a summary of the tuned hyperparameters, run:

```
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

To see detailed information about the TrainingJob, run:

```
kubectl describe trainingjobs <job name>
```

## Spawned Training Jobs

You can also track all 10 training jobs in Kubernetes launched by `HyperparameterTuningJob` by running the following command:

```
kubectl get trainingjobs
```

## Describe a Hyperparameter Tuning Job

You can obtain debugging details using the `describe` `kubectl` verb by running the following command.

```
kubectl describe hyperparametertuningjob xgboost-mnist-hpo
```

In addition to information about the tuning job, the SageMaker Operator for Kubernetes also exposes the [best training job](#) found by the hyperparameter tuning job in the `describe` output as follows:

```

```

## [View Logs from Hyperparameter Tuning Jobs](#)

Hyperparameter tuning jobs do not have logs, but all training jobs launched by them do have logs. These logs can be accessed as if they were a normal training job. For more information, see [View Logs from Training Jobs](#).

## [Delete a Hyperparameter tuning Job](#)

Use the following command to stop a hyperparameter job in SageMaker.

```
kubectl delete hyperparametertuningjob xgboost-mnist-hpo
```

This command removes the hyperparameter tuning job and associated training jobs from your Kubernetes cluster and stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. SageMaker does not delete hyperparameter tuning jobs. Stopped jobs continue to show on the SageMaker Console.

Your output should look like the following:

```
hyperparametertuningjob.sagemaker.aws.amazon.com "xgboost-mnist-hpo" deleted
```

**Note:** The delete command takes about 2 minutes to clean up the resources from SageMaker.

## [BatchTransformJobs operator](#)

Batch transform job operators reconcile your specified batch transform job spec to SageMaker by launching it in SageMaker. You can learn more about SageMaker batch transform job in the SageMaker [CreateTransformJob API documentation](#).

## Create a BatchTransformJob Using a Simple YAML File

1. Download the sample YAML file for the batch transform job using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-batchtransform.yaml
```

2. Edit the file `xgboost-mnist-batchtransform.yaml` to change necessary parameters to replace the `inputdataconfig` with your input data and `s3OutputPath` with your Amazon S3 buckets that the SageMaker execution role has write access to.
3. Apply the YAML file using the following command:

```
kubectl apply -f xgboost-mnist-batchtransform.yaml
```

## Create a BatchTransformJob Using a Helm Chart

You can use Helm Charts to run batch transform jobs.

### Get the Helm installer directory

Clone the GitHub repo to get the source using the following command:

```
git clone https://github.com/aws/amazon-sagemaker-operator-for-k8s.git
```

### Configure the Helm Chart

Navigate to the `amazon-sagemaker-operator-for-k8s/hack/charts/batch-transform-jobs/` folder.

Edit the `values.yaml` file to replace the `inputdataconfig` with your input data and `outputPath` with your S3 buckets to which the SageMaker execution role has write access.

### Create a Batch Transform Job

1. Use the following command to create a batch transform job:

```
helm install . --generate-name
```

Your output should look like the following:

```
NAME: chart-1574292948
LAST DEPLOYED: Wed Nov 20 23:35:49 2019
NAMESPACE: default
STATUS: deployed
REVISION: 1
TEST SUITE: None
NOTES:
Thanks for installing the sagemaker-k8s-batch-transform-job.
```

2. To verify that the Helm Chart was created successfully, run the following command:

```
helm ls
NAME          STATUS        LAST DEPLOYED   REVISION    UPDATED          APP VERSION
chart-1474292948     deployed      2019-11-20 23:35:49.9136092 +0000 UTC
```

```
chart-1474292948      default      1          2019-11-20 23:35:49.9136092
+0000 UTC  deployed    sagemaker-k8s-hyperparametertuningjob-0.1.0
chart-1574292948      default      1          2019-11-20 23:35:49.9136092
+0000 UTC  deployed    sagemaker-k8s-trainingjob-0.1.0
rolebased-1574291698  default      1          2019-11-20 23:14:59.6777082
+0000 UTC  deployed    sagemaker-k8s-operator-0.1.0
```

This command creates a `BatchTransformJob` Kubernetes resource. The operator launches the actual transform job in SageMaker and updates the `BatchTransformJob` Kubernetes resource to reflect the status of the job in SageMaker. You incur charges for SageMaker resources used during the duration of your job. You do not incur any charges once your job completes or stops.

**Note:** SageMaker does not allow you to update a running batch transform job. You cannot edit any parameter and re-apply the file/config. You must either change the metadata name or delete the existing job and create a new one. Similar to existing training job operators like `TFJob` in Kubeflow, update is not supported.

### List Batch Transform Jobs

Use the following command to list all jobs created using the Kubernetes operator:

```
kubectl get batchtransformjob
```

Your output should look like the following:

NAME	STATUS	CREATION-TIME	SAGEMAKER-JOB-NAME
xgboost-mnist-batch-transform a88fb19809b511eaac440aa8axgboost	Completed	2019-11-18T03:44:00Z	xgboost-mnist-

A batch transform job will continue to be listed after the job has completed or failed. You can remove a `hyperparametertuningjob` from the list by following the Delete a Batch Transform Job steps. Jobs that have completed or stopped do not incur any charges for SageMaker resources.

### Batch Transform Status Values

The `STATUS` field can be one of the following values:

- `Completed`
- `InProgress`
- `Failed`
- `Stopped`
- `Stopping`

These statuses come directly from the SageMaker official [API documentation](#).

In addition to the official SageMaker status, it is possible for `STATUS` to be `SynchronizingK8sJobWithSageMaker`. This means that the operator has not yet processed the job.

### Describe a Batch Transform Job

You can obtain debugging details using the `describe` `kubectl` verb by running the following command.

```
kubectl describe batchtransformjob xgboost-mnist-batch-transform
```

Your output should look like the following:

```

Name:          xgboost-mnist-batch-transform
Namespace:     default
Labels:        <none>
Annotations:   kubectl.kubernetes.io/last-applied-configuration:
                {"apiVersion":"sagemaker.aws.amazon.com/v1",
                 "kind":"BatchTransformJob", "metadata": {"annotations": {}, "name": "xgboost-mnist", "namespace": ...}}
API Version:  sagemaker.aws.amazon.com/v1
Kind:          BatchTransformJob
Metadata:
  Creation Timestamp: 2019-11-18T03:44:00Z
  Finalizers:
    sagemaker-operator-finalizer

  Transform Job Name: xgboost-mnist-a88fb19809b511eaac440aa8a9SMJOB
  Transform Output:
    S 3 Output Path: s3://my-bucket/mnist_kmeans_example/output
  Transform Resources:
    Instance Count: 1
    Instance Type: ml.m4.xlarge
Status:
  Last Check Time: 2019-11-19T22:50:40Z
  Sage Maker Transform Job Name: xgboost-mnist-a88fb19809b511eaac440aa8a9SMJOB
  Transform Job Status: Completed
Events: <none>

```

## View Logs from Batch Transform Jobs

Use the following command to see the logs from the `xgboost-mnist` batch transform job:

```
kubectl smlogs batchtransformjob xgboost-mnist-batch-transform
```

## Delete a Batch Transform Job

Use the following command to stop a batch transform job in SageMaker.

```
kubectl delete batchTransformJob xgboost-mnist-batch-transform
```

Your output should look like the following:

```
batchtransformjob.sagemaker.aws.amazon.com "xgboost-mnist" deleted
```

This command removes the batch transform job from your Kubernetes cluster, as well as stops them in SageMaker. Jobs that have stopped or completed do not incur any charges for SageMaker resources. Delete takes about 2 minutes to clean up the resources from SageMaker.

**Note:** SageMaker does not delete batch transform jobs. Stopped jobs continue to show on the SageMaker console.

## Real-time inference

HostingDeployments support creating and deleting an endpoint, as well as updating an existing endpoint. The hosting deployment operator reconciles your specified hosting deployment job spec to SageMaker by creating models, endpoint-configs and endpoints in SageMaker. You can learn more about SageMaker inference in the SageMaker [CreateEndpoint API documentaiton](#).

### Configure a HostingDeployment Resource

Download the sample YAML file for the hosting deployment job using the following command:

```
wget https://raw.githubusercontent.com/aws/amazon-sagemaker-operator-for-k8s/master/samples/xgboost-mnist-hostingdeployment.yaml
```

The `xgboost-mnist-hostingdeployment.yaml` file has the following components that can be edited as required:

- *ProductionVariants*. A production variant is a set of instances serving a single model. SageMaker load-balances between all production variants according to set weights.
- *Models*. A model is the containers and execution role ARN necessary to serve a model. It requires at least a single container.
- *Containers*. A container specifies the dataset and serving image. If you are using your own custom algorithm instead of an algorithm provided by SageMaker, the inference code must meet SageMaker requirements. For more information, see [Using Your Own Algorithms with SageMaker](#).

### Create a HostingDeployment

To create a HostingDeployment, use `kubectl` to apply the file `hosting.yaml` with the following command:

```
kubectl apply -f hosting.yaml
```

SageMaker creates an endpoint with the specified configuration. You incur charges for SageMaker resources used during the lifetime of your endpoint. You do not incur any charges once your endpoint is deleted.

The creation process takes approximately 10 minutes.

### List HostingDeployments

To verify that the HostingDeployment was created, use the following command:

```
kubectl get hostingdeployments
```

Your output should look like the following:

NAME	STATUS	SAGEMAKER-ENDPOINT-NAME
host-xgboost	Creating	host-xgboost-def0e83e0d5f11eaaa450aSMLOGS

### HostingDeployment Status Values

The status field can be one of several values:

- **SynchronizingK8sJobWithSageMaker**: The operator is preparing to create the endpoint.
- **ReconcilingEndpoint**: The operator is creating, updating, or deleting endpoint resources. If the HostingDeployment remains in this state, use `kubectl describe` to see the reason in the Additional field.

- **OutOfService**: Endpoint is not available to take incoming requests.
- **Creating**: [CreateEndpoint](#) is executing.
- **Updating**: [UpdateEndpoint](#) or [UpdateEndpointWeightsAndCapacities](#) is executing.
- **SystemUpdating**: Endpoint is undergoing maintenance and cannot be updated or deleted or re-scaled until it has completed. This maintenance operation does not change any customer-specified values such as VPC config, KMS encryption, model, instance type, or instance count.
- **RollingBack**: Endpoint fails to scale up or down or change its variant weight and is in the process of rolling back to its previous configuration. Once the rollback completes, endpoint returns to an **InService** status. This transitional status only applies to an endpoint that has autoscaling enabled and is undergoing variant weight or capacity changes as part of an [UpdateEndpointWeightsAndCapacities](#) call or when the [UpdateEndpointWeightsAndCapacities](#) operation is called explicitly.
- **InService**: Endpoint is available to process incoming requests.
- **Deleting**: [DeleteEndpoint](#) is executing.
- **Failed**: Endpoint could not be created, updated, or re-scaled. Use [DescribeEndpoint:FailureReason](#) for information about the failure. [DeleteEndpoint](#) is the only operation that can be performed on a failed endpoint.

### Describe a HostingDeployment

You can obtain debugging details using the `describe kubectl` verb by running the following command.

```
kubectl describe hostingdeployment
```

Your output should look like the following:

```
Name:          host-xgboost
Namespace:    default
Labels:        <none>
Annotations:   kubectl.kubernetes.io/last-applied-configuration:

  Model Names:
    Name: xgboost-model
    Value: xgboost-model-1-def0e83e0d5f11-df5cc9fd0d5f11eaaa450aexample
Events: <none>

```

The status field provides more information using the following fields:

- **Additional:** Additional information about the status of the hosting deployment. This field is optional and only gets populated in case of error.
- **Creation Time:** When the endpoint was created in SageMaker.
- **Endpoint ARN:** The SageMaker endpoint ARN.
- **Endpoint Config Name:** The SageMaker name of the endpoint configuration.
- **Endpoint Name:** The SageMaker name of the endpoint.
- **Endpoint Status:** The status of the endpoint.
- **Endpoint URL:** The HTTPS URL that can be used to access the endpoint. For more information, see [Deploy a Model on SageMaker Hosting Services](#).
- **FailureReason:** If a create, update, or delete command fails, the cause is shown here.
- **Last Check Time:** The last time the operator checked the status of the endpoint.
- **Last Modified Time:** The last time the endpoint was modified.
- **Model Names:** A key-value pair of HostingDeployment model names to SageMaker model names.

## Invoking the Endpoint

Once the endpoint status is `InService`, you can invoke the endpoint in two ways: using the Amazon CLI, which does authentication and URL request signing, or using an HTTP client like cURL. If you use your own client, you need to do Amazonv4 URL signing and authentication on your own.

To invoke the endpoint using the Amazon CLI, run the following command. Make sure to replace the Region and endpoint-name with your endpoint's Region and SageMaker endpoint name. This information can be obtained from the output of `kubectl describe`.

```
# Invoke the endpoint with mock input data.
aws sagemaker-runtime invoke-endpoint \
--region us-east-2 \
--endpoint-name <endpoint name> \
--body $(seq 784 | xargs echo | sed 's/ //g') \
>(cat) \
--content-type text/csv > /dev/null
```

For example, if your Region is `us-east-2` and your endpoint config name is `host-xgboost-f56b6b280d7511ea824b129926example`, then the following command would invoke the endpoint:

```
aws sagemaker-runtime invoke-endpoint \
--region us-east-2 \
--endpoint-name host-xgboost-f56b6b280d7511ea824b1299example \
--body $(seq 784 | xargs echo | sed 's/ //g') \
```

```
>(cat) \
--content-type text/csv > /dev/null
4.95847082138
```

Here, 4.95847082138 is the prediction from the model for the mock data.

## Update HostingDeployment

- Once a HostingDeployment has a status of `InService`, it can be updated. It might take about 10 minutes for HostingDeployment to be in service. To verify that the status is `InService`, use the following command:

```
kubectl get hostingdeployments
```

- The HostingDeployment can be updated before the status is `InService`. The operator waits until the SageMaker endpoint is `InService` before applying the update.

To apply an update, modify the `hosting.yaml` file. For example, change the `initialInstanceCount` field from 1 to 2 as follows:

```
apiVersion: sagemaker.aws.amazon.com/v1
kind: HostingDeployment
metadata:
  name: host-xgboost
spec:
  region: us-east-2
  productionVariants:
    - variantName: all-traffic
      modelName: xgboost-model
      initialInstanceCount: 2
      instanceType: ml.c5.large
  models:
    - name: xgboost-model
      executionRoleArn: arn:aws:iam::123456789012:role/service-role/
        AmazonSageMaker-ExecutionRole
      primaryContainer: xgboost
      containers:
        - xgboost
  containers:
    - containerHostname: xgboost
      modelDataUrl: s3://my-bucket/inference/xgboost-mnist/model.tar.gz
      image: 123456789012.dkr.ecr.us-east-2.amazonaws.com/xgboost:latest
```

- Save the file, then use `kubectl` to apply your update as follows. You should see the status change from `InService` to `ReconcilingEndpoint`, then `Updating`.

```
$ kubectl apply -f hosting.yaml
hostingdeployment.sagemaker.aws.amazon.com/host-xgboost configured

$ kubectl get hostingdeployments
NAME           STATUS          SAGEMAKER-ENDPOINT-NAME
host-xgboost   ReconcilingEndpoint  host-xgboost-def0e83e0d5f11eaaa450a350abcdef

$ kubectl get hostingdeployments
NAME           STATUS          SAGEMAKER-ENDPOINT-NAME
host-xgboost   Updating       host-xgboost-def0e83e0d5f11eaaa450a3507abcdef
```

SageMaker deploys a new set of instances with your models, switches traffic to use the new instances, and drains the old instances. As soon as this process begins, the status becomes `Updating`. After the update is complete, your endpoint becomes `InService`. This process takes approximately 10 minutes.

## Delete the HostingDeployment

1. Use `kubectl` to delete a HostingDeployment with the following command:

```
kubectl delete hostingdeployments host-xgboost
```

Your output should look like the following:

```
hostingdeployment.sagemaker.aws.amazon.com "host-xgboost" deleted
```

2. To verify that the hosting deployment has been deleted, use the following command:

```
kubectl get hostingdeployments  
No resources found.
```

Endpoints that have been deleted do not incur any charges for SageMaker resources.

# SageMaker Components for Kubeflow Pipelines

This document outlines how to use SageMaker Components for Kubeflow Pipelines (KFP). With these pipeline components, you can create and monitor training, tuning, endpoint deployment, and batch transform jobs in SageMaker. By running Kubeflow Pipeline jobs on SageMaker, you move data processing and training jobs from the Kubernetes cluster to SageMaker's machine learning-optimized managed service. This document assumes prior knowledge of Kubernetes and Kubeflow.

## Contents

- [What is Kubeflow Pipelines? \(p. 2294\)](#)
- [Kubeflow Pipeline components \(p. 2295\)](#)
- [IAM permissions \(p. 2296\)](#)
- [Converting Pipelines to use SageMaker \(p. 2296\)](#)
- [Using SageMaker Components \(p. 2297\)](#)

## What is Kubeflow Pipelines?

Kubeflow Pipelines (KFP) is a platform for building and deploying portable, scalable machine learning (ML) workflows based on Docker containers. The Kubeflow Pipelines platform consists of the following:

- A user interface (UI) for managing and tracking experiments, jobs, and runs.
- An engine (Argo) for scheduling multi-step ML workflows.
- A Python SDK for defining and manipulating pipelines and components.
- Notebooks for interacting with the system using the SDK.

A pipeline is a description of an ML workflow expressed as a directed acyclic [graph](#) as shown in the following diagram. Every step in the workflow is expressed as a Kubeflow Pipeline [component](#), which is a Python module.

If your data has been preprocessed, the standard pipeline takes a subset of the data and runs hyperparameter optimization of the model. The pipeline then trains a model with the full dataset using the optimal hyperparameters. This model is used for both batch inference and endpoint creation.

For more information on Kubeflow Pipelines, see the [Kubeflow Pipelines documentation](#).

## Kubeflow Pipeline components

A Kubeflow Pipeline component is a set of code used to execute one step in a Kubeflow pipeline. Components are represented by a Python module that is converted into a Docker image. These components make it fast and easy to write pipelines for experimentation and production environments without having to interact with the underlying Kubernetes infrastructure.

### What do SageMaker Components for Kubeflow Pipelines provide?

SageMaker Components for Kubeflow Pipelines offer an alternative to launching compute-intensive jobs in SageMaker. These components integrate SageMaker with the portability and orchestration of Kubeflow Pipelines. Using the SageMaker components, each of the jobs in the pipeline workflow runs on SageMaker instead of the local Kubernetes cluster. The job parameters, status, logs, and outputs from SageMaker are still accessible from the Kubeflow Pipelines UI. The following SageMaker components have been created to integrate six key SageMaker features into your ML workflows. You can create a Kubeflow Pipeline built entirely using these components, or integrate individual components into your workflow as needed.

There is no additional charge for using SageMaker Components for Kubeflow Pipelines. You incur charges for any SageMaker resources you use through these components.

#### [Training components](#)

##### **Training**

The Training component allows you to submit SageMaker Training jobs directly from a Kubeflow Pipelines workflow. For more information, see [SageMaker Training Kubeflow Pipelines component](#).

##### **Hyperparameter Optimization**

The Hyperparameter Optimization component enables you to submit hyperparameter tuning jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see [SageMaker hyperparameter optimization Kubeflow Pipeline component](#).

##### **Processing**

The Processing component enables you to submit processing jobs to SageMaker directly from a Kubeflow Pipelines workflow. For more information, see [SageMaker Processing Kubeflow Pipeline component](#).

#### [Inference components](#)

##### **Hosting Deploy**

The Deploy component enables you to deploy a model in SageMaker Hosting from a Kubeflow Pipelines workflow. For more information, see [SageMaker Hosting Services - Create Endpoint Kubeflow Pipeline component](#).

##### **Batch Transform component**

The Batch Transform component enables you to run inference jobs for an entire dataset in SageMaker from a Kubeflow Pipelines workflow. For more information, see [SageMaker Batch Transform Kubeflow Pipeline component](#).

#### [Ground Truth components](#)

**Ground Truth** The Ground Truth component enables you to submit SageMaker Ground Truth labeling jobs directly from a Kubeflow Pipelines workflow. For more information, see [SageMaker Ground Truth Kubeflow Pipelines component](#).

## Workteam

The Workteam component enables you to create SageMaker private workteam jobs directly from a Kubeflow Pipelines workflow. For more information, see [SageMaker create private workteam Kubeflow Pipelines component](#).

## IAM permissions

Deploying Kubeflow Pipelines with SageMaker components requires the following three levels of IAM permissions:

- An IAM user/role to access your Amazon account (**your\_credentials**). Note: You don't need this at all if you already have access to KFP web UI and have your input data in Amazon S3, or if you already have an Amazon Elastic Kubernetes Service (Amazon EKS) cluster with KFP.

You use this user/role from your gateway node, which can be your local machine or a remote instance, to:

- Create an Amazon EKS cluster and install KFP
- Create IAM roles/users
- Create Amazon S3 buckets for your sample input data

The IAM user/role needs the following permissions:

- CloudWatchLogsFullAccess
- [AWSCloudFormationFullAccess](#)
- IAMFullAccess
- AmazonS3FullAccess
- AmazonEC2FullAccess
- AmazonEKSAdminPolicy (Create this policy using the schema from [Amazon EKS Identity-Based Policy Examples](#))

- An IAM role used by KFP pods to access SageMaker (**kfp-example-pod-role**) The KFP pods use this permission to create SageMaker jobs from KFP components. Note: If you want to limit permissions to the KFP pods, create your own custom policy and attach it.

The role needs the following permission:

- AmazonSageMakerFullAccess
- An IAM role used by SageMaker jobs to access resources such as Amazon S3 and Amazon ECR etc. (**kfp-example-sagemaker-execution-role**).

Your SageMaker jobs use this role to:

- Access SageMaker resources
- Input Data from Amazon S3
- Store your output model to Amazon S3

The role needs the following permissions:

- AmazonSageMakerFullAccess
- AmazonS3FullAccess

These are all the IAM users/roles you need to run KFP components for SageMaker.

When you have run the components and have created the SageMaker endpoint, you also need a role with the `sagemaker:InvokeEndpoint` permission to query inference endpoints.

## Converting Pipelines to use SageMaker

You can convert an existing pipeline to use SageMaker by porting your generic Python [processing containers](#) and [training containers](#). If you are using SageMaker for inference, you also need to attach IAM permissions to your cluster and convert an artifact to a model.

## Using SageMaker Components

In this tutorial, you run a pipeline using SageMaker Components for Kubeflow Pipelines to train a classification model using Kmeans with the MNIST dataset. This workflow uses Kubeflow pipelines as the orchestrator and SageMaker as the backend to run the steps in the workflow. For the full code for this and other pipeline examples, see the [Sample SageMaker Kubeflow Pipelines](#). For information on the components used, see the [KubeFlow Pipelines GitHub repository](#).

### Contents

- [Setup \(p. 2297\)](#)
- [Running the Kubeflow Pipeline \(p. 2303\)](#)

## Setup

To use Kubeflow Pipelines (KFP), you need an Amazon Elastic Kubernetes Service (Amazon EKS) cluster and a gateway node to interact with that cluster. The following sections show the steps needed to set up these resources.

### Topics

- [Set up a gateway node \(p. 2297\)](#)
- [Set up an Amazon EKS cluster \(p. 2298\)](#)
- [Install Kubeflow Pipelines \(p. 2298\)](#)
- [Access the KFP UI \(p. 2299\)](#)
- [Create IAM Users/Roles for KFP pods and the SageMaker service \(p. 2300\)](#)
- [Add access to additional IAM users or roles \(p. 2302\)](#)

### Set up a gateway node

A gateway node is used to create an Amazon EKS cluster and access the Kubeflow Pipelines UI. Use your local machine or an Amazon EC2 instance as your gateway node. If you want to use a new Amazon EC2 instance, create one with the latest Ubuntu 18.04 DLAMI version from the Amazon console using the steps in [Launching and Configuring a DLAMI](#).

Complete the following steps to set up your gateway node. Depending on your environment, you may have certain requirements already configured.

1. If you don't have an existing Amazon EKS cluster, create a user named `your_credentials` using the steps in [Creating an IAM User in Your Amazon Account](#). If you have an existing Amazon EKS cluster, use the credentials of the IAM role or user that has access to it.
2. Add the following permissions to your user using the steps in [Changing Permissions for an IAM User](#):
  - `CloudWatchLogsFullAccess`
  - `AWSCloudFormationFullAccess`
  - `IAMFullAccess`
  - `AmazonS3FullAccess`
  - `AmazonEC2FullAccess`
  - `AmazonEKSAdminPolicy` (Create this policy using the schema from [Amazon EKS Identity-Based Policy Examples](#))
3. Install the following on your gateway node to access the Amazon EKS cluster and KFP UI.
  - [Amazon CLI](#). If you are using an IAM user, configure your `Access Key ID`, `Secret Access Key` and preferred Amazon Region by running: `aws configure`
  - [aws-iam-authenticator](#) version 0.1.31 and above
  - [eksctl](#) version above 0.15.

- [kubectl](#) (The version needs to match your Kubernetes version within one minor version)
4. Install boto3.

```
pip install boto3
```

## Set up an Amazon EKS cluster

Run the following steps from the command line of your gateway node to set up an Amazon EKS cluster:

1. If you do not have an existing Amazon EKS cluster, complete the following substeps. If you already have an Amazon EKS cluster, skip this step.
  - a. Run the following from your command line to create an Amazon EKS Cluster with version 1.14 or above. Replace <your-cluster-name> with any name for your cluster.

```
eksctl create cluster --name <your-cluster-name> --region us-east-1 --auto-kubeconfig --timeout=50m --managed --nodes=1
```

- b. When cluster creation is complete, verify that you have access to the cluster using the following command.

```
kubectl get nodes
```

2. Verify that the current kubectl context is the cluster you want to use with the following command. The current context is marked with an asterisk (\*) in the output.

```
kubectl config get-contexts
```

CURRENT NAME	CLUSTER
*	<username>@<clusternode>.us-east-1.eksctl.io <clusternode>.us-east-1.eksctl.io

3. If the desired cluster is not configured as your current default, update the default with the following command.

```
aws eks update-kubeconfig --name <clusternode> --region us-east-1
```

## Install Kubeflow Pipelines

Run the following steps from the command line of your gateway node to install Kubeflow Pipelines on your cluster.

1. Install Kubeflow Pipelines on your cluster by following step 1 of [Deploying Kubeflow Pipelines documentation](#). Your KFP version must be 0.5.0 or above.
2. Verify that the Kubeflow Pipelines service and other related resources are running.

```
kubectl -n kubeflow get all | grep pipeline
```

Your output should look like the following.

pod/ml-pipeline-6b88c67994-kdtjv 2d	1/1	Running	0
pod/ml-pipeline-persistenceagent-64d74dfdbf-66stk 2d	1/1	Running	0

2d			

## Access the KFP UI

The Kubeflow Pipelines UI is used for managing and tracking experiments, jobs, and runs on your cluster. You can use port forwarding to access the Kubeflow Pipelines UI from your gateway node.

### Set up port forwarding to the KFP UI service

Run the following from the command line of your gateway node:

- Verify that the KFP UI service is running using the following command:

```
kubectl -n kubeflow get service ml-pipeline-ui

NAME           TYPE      CLUSTER-IP    EXTERNAL-IP   PORT(S)    AGE
ml-pipeline-ui  ClusterIP  10.100.38.71  <none>        80/TCP     2d22h
```

- Run the following command to set up port forwarding to the KFP UI service. This forwards the KFP UI to port 8080 on your gateway node and allows you to access the KFP UI from your browser.

```
kubectl port-forward -n kubeflow service/ml-pipeline-ui 8080:80
```

The port forward from your remote machine drops if there is no activity. Run this command again if your dashboard is unable to get logs or updates. If the commands return an error, ensure that there is no process already running on the port you are trying to use.

## Access the KFP UI service

Your method of accessing the KFP UI depends on your gateway node type.

- Local machine as the gateway node

1. Access the dashboard in your browser as follows:

```
http://localhost:8080
```

2. Choose **Pipelines** to access the pipelines UI.

- Amazon EC2 instance as the gateway node

1. You need to set up an SSH tunnel on your Amazon EC2 instance to access the Kubeflow dashboard from your local machine's browser.

From a new terminal session in your local machine, run the following. Replace <public-DNS-of-gateway-node> with the IP address of your instance found on the Amazon EC2 console. You can also use the public DNS. Replace <path\_to\_key> with the path to the pem key used to access the gateway node.

```
public_DNS_address=<public-DNS-of-gateway-node>
key=<path_to_key>

on Ubuntu:
ssh -i ${key} -L 9000:localhost:8080 ubuntu@${public_DNS_address}

or on Amazon Linux:
ssh -i ${key} -L 9000:localhost:8080 ec2-user@${public_DNS_address}
```

2. Access the dashboard in your browser.

```
http://localhost:9000
```

3. Choose **Pipelines** to access the KFP UI.

## Create IAM Users/Roles for KFP pods and the SageMaker service

You now have a Kubernetes cluster with Kubeflow set up. To run SageMaker Components for Kubeflow Pipelines, the Kubeflow Pipeline pods need access to SageMaker. In this section, you create IAM users/roles to be used by Kubeflow Pipeline pods and SageMaker.

### Create a KFP execution role

Run the following from the command line of your gateway node:

1. Enable OIDC support on the Amazon EKS cluster with the following command. Replace <cluster\_name> with the name of your cluster and <cluster\_region> with the region your cluster is in.

```
eksctl utils associate-iam-oidc-provider --cluster <cluster-name> \
--region <cluster-region> --approve
```

2. Run the following to get the **OIDC** issuer URL. This URL is in the form `https://oidc.eks.<region>.amazonaws.com/id/<OIDC_ID>`.

```
aws eks describe-cluster --region <cluster-region> --name <cluster-name> --query
"cluster.identity.oidc.issuer" --output text
```

3. Run the following to create a file named `trust.json`. Replace <OIDC\_URL> with your OIDC issuer URL. Don't include `https://` when in your OIDC issuer URL. Replace <AWS\_account\_number> with your Amazon account number.

```

OIDC_URL="<OIDC-URL>"
AWS_ACC_NUM="<AWS-account-number>"

# Run this to create trust.json file
cat <<EOF > trust.json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Federated": "arn:aws:iam::${AWS_ACC_NUM}:oidc-provider/${OIDC_URL}"
            },
            "Action": "sts:AssumeRoleWithWebIdentity",
            "Condition": {
                "StringEquals": {
                    "${OIDC_URL}:aud": "sts.amazonaws.com",
                    "${OIDC_URL}:sub": "system:serviceaccount:kubeflow:pipeline-runner"
                }
            }
        }
    ]
}
EOF

```

4. Create an IAM role named `kfp-example-pod-role` using `trust.json` using the following command. This role is used by KFP pods to create SageMaker jobs from KFP components. Note the ARN returned in the output.

```

aws iam create-role --role-name kfp-example-pod-role --assume-role-policy-document
file://trust.json
aws iam attach-role-policy --role-name kfp-example-pod-role --policy-arn
arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
aws iam get-role --role-name kfp-example-pod-role --output text --query 'Role.Arn'

```

5. Edit your pipeline-runner service account with the following command.

```
kubectl edit -n kubeflow serviceaccount pipeline-runner
```

6. In the file, add the following Amazon EKS role annotation and replace `<role_arn>` with your role ARN.

```
eks.amazonaws.com/role-arn: <i><role-arn></i>
```

7. Your file should look like the following when you've added the Amazon EKS role annotation. Save the file.

```

apiVersion: v1
kind: ServiceAccount
metadata:
  annotations:
    eks.amazonaws.com/role-arn: <i><role-arn></i>
    kubectl.kubernetes.io/last-applied-configuration: |
      {"apiVersion":"v1","kind":"ServiceAccount","metadata":{"annotations":{},"labels":{"app":"pipeline-runner","app.kubernetes.io/component":"pipelines-runner","app.kubernetes.io/instance":"pipelines-runner-0.2.0","app.kubernetes.io/managed-by":"kfctl","app.kubernetes.io/name":"pipelines-runner","app.kubernetes.io/part-of":"kubeflow","app.kubernetes.io/version":"0.2.0"},"name":"pipeline-runner","namespace":"kubeflow"}}
    creationTimestamp: "2020-04-16T05:48:06Z"
    labels:

```

```

app: pipeline-runner
app.kubernetes.io/component: pipelines-runner
app.kubernetes.io/instance: pipelines-runner-0.2.0
app.kubernetes.io/managed-by: kfctl
app.kubernetes.io/name: pipelines-runner
app.kubernetes.io/part-of: kubeflow
app.kubernetes.io/version: 0.2.0
name: pipeline-runner
namespace: kubeflow
resourceVersion: "11787"
selfLink: /api/v1/namespaces/kubeflow/serviceaccounts/pipeline-runner
uid: d86234bd-7fa5-11ea-a8f2-02934be6dc88
secrets:
- name: pipeline-runner-token-dkjrk

```

## Create an SageMaker execution role

The `kfp-example-sagemaker-execution-role` IAM role is used by SageMaker jobs to access Amazon resources. For more information, see the [IAM Permissions](#) section. You provide this role as an input parameter when running the pipeline.

Run the following to create the role. Note the ARN that is returned in your output.

```

SAGEMAKER_EXECUTION_ROLE_NAME=kfp-example-sagemaker-execution-role

TRUST="{"Version": "2012-10-17", "Statement": [ { "Effect": "Allow", "Principal": "*", "Service": "sagemaker.amazonaws.com"}, {"Action": "sts:AssumeRole"} ] }"
aws iam create-role --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --assume-role-policy-document "$TRUST"
aws iam attach-role-policy --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
aws iam attach-role-policy --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess

aws iam get-role --role-name ${SAGEMAKER_EXECUTION_ROLE_NAME} --output text --query 'Role.Arn'

```

## Add access to additional IAM users or roles

If you use an intuitive IDE like Jupyter or want other people in your organization to use the cluster you set up, you can also give them access. The following steps run through this workflow using SageMaker notebooks. An SageMaker notebook instance is a fully managed Amazon EC2 compute instance that runs the Jupyter Notebook App. You use the notebook instance to create and manage Jupyter notebooks to create ML workflows. You can define, compile, deploy, and run your pipeline using the KFP Python SDK or CLI. If you're not using an SageMaker notebook to run Jupyter, you need to install the [Amazon CLI](#) and the latest version of [kubectl](#).

1. Follow the steps in [Create an SageMaker Notebook Instance](#) to create a SageMaker notebook instance if you do not already have one. Give the IAM role for this instance the S3FullAccess permission.
2. Amazon EKS clusters use IAM users and roles to control access to the cluster. The rules are implemented in a config map named `aws-auth`. Only the user/role that has access to the cluster will be able to edit this config map. Run the following from the command line of your gateway node to get the IAM role of the notebook instance you created. Replace `<instance-name>` with the name of your instance.

```

aws sagemaker describe-notebook-instance --notebook-instance-name <instance-name> --region <region> --output text --query 'RoleArn'

```

This command outputs the IAM role ARN in the `arn:aws:iam::<account-id>:role/<role-name>` format. Take note of this ARN.

- Run the following to attach the policies the IAM role. Replace `<role-name>` with the `<role-name>` in your ARN.

```
aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonSageMakerFullAccess
aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonEKSWorkerNodePolicy
aws iam attach-role-policy --role-name <role-name> --policy-arn arn:aws:iam::aws:policy/AmazonS3FullAccess
```

- eksctl provides commands to read and edit the `aws-auth` config map. `system:masters` is one of the default user groups. You add the user to this group. The `system:masters` group has super user permissions to the cluster. You can also create a group with more restrictive permissions or you can bind permissions directly to users. Replace `<IAM-Role-arn>` with the ARN of the IAM role. `<your_username>` can be any unique username.

```
eksctl create iamidentitymapping \
--cluster <cluster-name> \
--arn <IAM-Role-arn> \
--group system:masters \
--username <your-username> \
--region <region>
```

- Open the Jupyter notebook on your SageMaker instance and run the following to verify that it has access to the cluster.

```
aws eks --region <region> update-kubeconfig --name <cluster-name>
kubectl -n kubeflow get all | grep pipeline
```

## Running the Kubeflow Pipeline

Now that setup of your gateway node and Amazon EKS cluster is complete, you can create your classification pipeline. To create your pipeline, you need to define and compile it. You then deploy it and use it to run workflows. You can define your pipeline in Python and use the KFP dashboard, KFP CLI, or Python SDK to compile, deploy, and run your workflows. The full code for the MNIST classification pipeline example is available in the [Kubeflow Github repository](#). To use it, clone the example Python files to your gateway node.

### Topics

- [Prepare datasets \(p. 2303\)](#)
- [Create a Kubeflow Pipeline using SageMaker Components \(p. 2304\)](#)
- [Compile and deploy your pipeline \(p. 2304\)](#)
- [Running predictions \(p. 2306\)](#)
- [View results and logs \(p. 2308\)](#)
- [Cleanup \(p. 2308\)](#)

### Prepare datasets

To run the pipelines, you need to upload the data extraction pre-processing script to an Amazon S3 bucket. This bucket and all resources for this example must be located in the `us-east-1` Amazon Region. If you don't have a bucket, create one using the steps in [Creating a bucket](#).

From the `mnist-kmeans-sagemaker` folder of the Kubeflow repository you cloned on your gateway node, run the following command to upload the `kmeans_preprocessing.py` file to your Amazon S3 bucket. Change `<bucket-name>` to the name of the Amazon S3 bucket you created.

```
aws s3 cp mnist-kmeans-sagemaker/kmeans_preprocessing.py s3://<bucket-name>/mnist_kmeans_example/processing_code/kmeans_preprocessing.py
```

## Create a Kubeflow Pipeline using SageMaker Components

The full code for the MNIST classification pipeline is available in the [Kubeflow Github repository](#). To use it, clone the example Python files to your gateway node.

### Input Parameters

The full MNIST classification pipeline has run-specific parameters for which you must provide values when creating a run. You must provide these parameters for each component of your pipeline. These parameters can also be updated when using other pipelines. We have provided default values for all parameters in the sample classification pipeline file.

The following are the only parameters you need to pass to run the sample pipelines. To pass these parameters, update their entries when creating a new run.

- **Role-ARN:** This must be the ARN of an IAM role that has full SageMaker access in your Amazon account. Use the ARN of `kfp-example-pod-role`.
- **Bucket:** This is the name of the Amazon S3 bucket that you uploaded the `kmeans_preprocessing.py` file to.

You can adjust any of the input parameters using the KFP UI and trigger your run again.

## Compile and deploy your pipeline

After defining the pipeline in Python, you must compile the pipeline to an intermediate representation before you can submit it to the Kubeflow Pipelines service. The intermediate representation is a workflow specification in the form of a YAML file compressed into a tar.gz file. You need the KFP SDK to compile your pipeline.

### Install KFP SDK

Run the following from the command line of your gateway node:

1. Install the KFP SDK following the instructions in the [Kubeflow pipelines documentation](#).
2. Verify that the KFP SDK is installed with the following command:

```
pip show kfp
```

3. Verify that `dsl-compile` has been installed correctly as follows:

```
which dsl-compile
```

## Compile your pipeline

You have three options to interact with Kubeflow Pipelines: KFP UI, KFP CLI, or the KFP SDK. The following sections illustrate the workflow using the KFP UI and CLI.

Complete the following from your gateway node to compile your pipeline.

1. Modify your Python file with your Amazon S3 bucket name and IAM role ARN.
2. Use the `dsl-compile` command from the command line to compile your pipeline as follows. Replace `<path-to-python-file>` with the path to your pipeline and `<path-to-output>` with the location where you want your tar.gz file to be.

```
dsl-compile --py <path-to-python-file> --output <path-to-output>
```

## Upload and run the pipeline using the KFP CLI

Complete the following steps from the command line of your gateway node. KFP organizes runs of your pipeline as experiments. You have the option to specify an experiment name. If you do not specify one, the run will be listed under **Default** experiment.

1. Upload your pipeline as follows:

```
kfp pipeline upload --pipeline-name <pipeline-name> <path-to-output-tar.gz>
```

Your output should look like the following. Take note of the ID.

```
Pipeline 29c3ff21-49f5-4dfe-94f6-618c0e2420fe has been submitted

Pipeline Details
-----
ID      29c3ff21-49f5-4dfe-94f6-618c0e2420fe
Name    sm-pipeline
Description
Uploaded at 2020-04-30T20:22:39+00:00
...
...
```

2. Create a run using the following command. The KFP CLI run command currently does not support specifying input parameters while creating the run. You need to update your parameters in the Python pipeline file before compiling. Replace `<experiment-name>` and `<job-name>` with any names. Replace `<pipeline-id>` with the ID of your submitted pipeline. Replace `<your-role-arn>` with the ARN of `kfp-example-pod-role`. Replace `<your-bucket-name>` with the name of the Amazon S3 bucket you created.

```
kfp run submit --experiment-name <experiment-name> --run-name <job-name> --pipeline-id <pipeline-id> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"
```

You can also directly submit a run using the compiled pipeline package created as the output of the `dsl-compile` command.

```
kfp run submit --experiment-name <experiment-name> --run-name <job-name> --package-file <path-to-output> role_arn="<your-role-arn>" bucket_name="<your-bucket-name>"
```

Your output should look like the following:

```
Creating experiment aws.
Run 95084a2c-f18d-4b77-a9da-eba00bf01e63 is submitted
+-----+-----+-----+
+   | run id                  | name    | status   | created at
|   |
+-----+-----+-----+
+-----+-----+-----+
```

```
| 95084a2c-f18d-4b77-a9da-eba00bf01e63 | sm-job | 2020-04-30T20:36:41+00:00
| |
+-----+-----+-----+
|
```

3. Navigate to the UI to check the progress of the job.

### Upload and run the pipeline using the KFP UI

1. On the left panel, choose the **Pipelines** tab.
2. In the upper-right corner, choose **+UploadPipeline**.
3. Enter the pipeline name and description.
4. Choose **Upload a file** and enter the path to the tar.gz file you created using the CLI or with the Python SDK.
5. On the left panel, choose the **Pipelines** tab.
6. Find the pipeline you created.
7. Choose **+CreateRun**.
8. Enter your input parameters.
9. Choose **Run**.

### Running predictions

Once your classification pipeline is deployed, you can run classification predictions against the endpoint that was created by the Deploy component. Use the KFP UI to check the output artifacts for `sagemaker-deploy-model-endpoint_name`. Download the .tgz file to extract the endpoint name or check the SageMaker console in the region you used.

### Configure permissions to run predictions

If you want to run predictions from your gateway node, skip this section.

1. To use any other machine to run predictions, assign the `sagemaker:InvokeEndpoint` permission to the IAM role or IAM user used by the client machine. This permission is used to run predictions.
2. On your gateway node, run the following to create a policy file:

```
cat <<EoF > ./sagemaker-invoke.json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:InvokeEndpoint"
            ],
            "Resource": "*"
        }
    ]
}
EoF
```

3. Attach the policy to the client node's IAM role or IAM user.
4. If your client machine has an IAM role attached, run the following. Replace `<your-instance-IAM-role>` with the name of the client node's IAM role. Replace `<path-to-sagemaker-invoke-json>` with the path to the policy file you created.

```
aws iam put-role-policy --role-name <your-instance-IAM-role> --policy-name sagemaker-  
invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>
```

5. If your client machine has IAM user credentials configured, run the following. Replace <your\_IAM\_user\_name> with the name of the client node's IAM user. Replace <path-to-sagemaker-invoke-json> with the path to the policy file you created.

```
aws iam put-user-policy --user-name <your-IAM-user-name> --policy-name sagemaker-  
invoke-for-worker --policy-document file://<path-to-sagemaker-invoke-json>
```

## Run predictions

1. Create a Python file from your client machine named `mnist-predictions.py` with the following content. Replace the `ENDPOINT_NAME` variable. This script loads the MNIST dataset, then creates a CSV from those digits and sends it to the endpoint for prediction. It then outputs the results.

```
import boto3
import gzip
import io
import json
import numpy
import pickle

ENDPOINT_NAME='<endpoint-name>'
region = boto3.Session().region_name

# S3 bucket where the original mnist data is downloaded and stored
downloaded_data_bucket = f"jumpstart-cache-prod-{region}"
downloaded_data_prefix = "1p-notebooks-datasets/mnist"

# Download the dataset
s3 = boto3.client("s3")
s3.download_file(downloaded_data_bucket, f"{downloaded_data_prefix}/mnist.pkl.gz",
                 "mnist.pkl.gz")

# Load the dataset
with gzip.open('mnist.pkl.gz', 'rb') as f:
    train_set, valid_set, test_set = pickle.load(f, encoding='latin1')

# Simple function to create a csv from our numpy array
def np2csv(arr):
    csv = io.BytesIO()
    numpy.savetxt(csv, arr, delimiter=',', fmt='%g')
    return csv.getvalue().decode().rstrip()

runtime = boto3.Session(region).client('sagemaker-runtime')

payload = np2csv(train_set[0][30:31])

response = runtime.invoke_endpoint(EndpointName=ENDPOINT_NAME,
                                    ContentType='text/csv',
                                    Body=payload)
result = json.loads(response['Body'].read().decode())
print(result)
```

2. Run the Python file as follows:

```
python mnist-predictions.py
```

## [View results and logs](#)

When the pipeline is running, you can choose any component to check execution details, such as inputs and outputs. This lists the names of created resources.

If the KFP request is successfully processed and an SageMaker job is created, the component logs in the KFP UI provide a link to the job created in SageMaker. The CloudWatch logs are also provided if the job is successfully created.

If you run too many pipeline jobs on the same cluster, you may see an error message that indicates you do not have enough pods available. To fix this, log in to your gateway node and delete the pods created by the pipelines you are not using as follows:

```
kubectl get pods -n kubeflow
kubectl delete pods -n kubeflow <name-of-pipeline-pod>
```

## [Cleanup](#)

When you're finished with your pipeline, you need to clean up your resources.

1. From the KFP dashboard, terminate your pipeline runs if they do not exit properly by choosing **Terminate**.
2. If the **Terminate** option doesn't work, log in to your gateway node and manually terminate all the pods created by your pipeline run as follows:

```
kubectl get pods -n kubeflow
kubectl delete pods -n kubeflow <name-of-pipeline-pod>
```

3. Using your Amazon account, log in to the SageMaker service. Manually stop all training, batch transform, and HPO jobs. Delete models, data buckets, and endpoints to avoid incurring any additional costs. Terminating the pipeline runs does not stop the jobs in SageMaker.

# Using Amazon Augmented AI for Human Review

This feature is not available in the China Regions.

When you use AI applications such as Amazon Rekognition, Amazon Textract, or your custom machine learning (ML) models, you can use Amazon Augmented AI to get human review of low-confidence predictions or random prediction samples.

## What is Amazon Augmented AI?

Amazon Augmented AI (Amazon A2I) is a service that brings human review of ML predictions to all developers by removing the heavy lifting associated with building human review systems or managing large numbers of human reviewers.

Many ML applications require humans to review low-confidence predictions to ensure the results are correct. For example, extracting information from scanned mortgage application forms can require human review due to low-quality scans or poor handwriting. Building human review systems can be time-consuming and expensive because it involves implementing complex processes or *workflows*, writing custom software to manage review tasks and results, and managing large groups of reviewers.

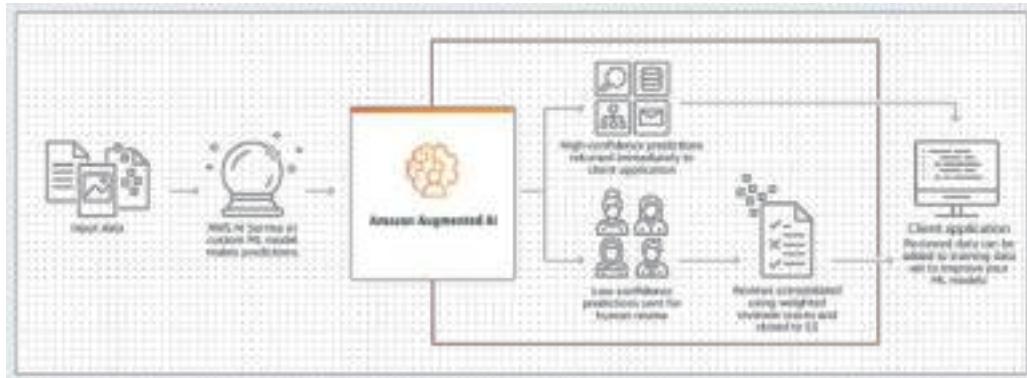

Amazon A2I streamlines building and managing human reviews for ML applications. Amazon A2I provides built-in human review workflows for common ML use cases, such as content moderation and text extraction from documents. You can also create your own workflows for ML models built on SageMaker or any other tools. Using Amazon A2I, you can allow human reviewers to step in when a model is unable to make a high-confidence prediction or to audit its predictions on an ongoing basis.

## Amazon A2I Use Case Examples

The following examples demonstrate how you can use Amazon A2I to integrate a human review loop into your ML application. For each of these examples, you can find a Jupyter Notebook that demonstrates that workflow in [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#).

- **Use Amazon A2I with Amazon Textract** – Have humans review important key-value pairs in single-page documents or have Amazon Textract randomly sample and send documents from your dataset to humans for review.
- **Use Amazon A2I with Amazon Rekognition** – Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low-confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.
- **Use Amazon A2I to review real-time ML inferences** – Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.
- **Use Amazon A2I with Amazon Comprehend** – Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.
- **Use Amazon A2I with Amazon Transcribe** – Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.

- **Use Amazon A2I with Amazon Translate** – Have humans review low-confidence translations returned from Amazon Translate.
- **Use Amazon A2I to review tabular data** – Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.

## Get Started with Amazon Augmented AI

To get started using Amazon Augmented AI, review the [Core Components of Amazon A2I \(p. 2310\)](#) and [Prerequisites to Using Augmented AI \(p. 2314\)](#). Then, use the following documentation to learn how to use the Amazon A2I console and API.

- [Tutorial: Get Started in the Amazon A2I Console \(p. 2314\)](#)
- [Tutorial: Get Started Using the Amazon A2I API \(p. 2320\)](#)

You can also get started using the Amazon A2I API by following a Jupyter Notebook tutorial. See [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#) for a list of notebooks and use cases.

## Core Components of Amazon A2I

Review the following terms to familiarize yourself with the core components of Amazon A2I.

## Task Types

The AI/ML workflow into which you integrate Amazon A2I defines an Amazon A2I *task type*.

Amazon A2I supports:

- Two *built-in task types*: [Amazon Textract key-value pair extraction](#) and [Amazon Rekognition image moderation](#).
- A *custom task type*: Use a custom task type to integrate a human review loop into *any* machine learning workflow. You can use a custom task type to integrate Amazon A2I with other Amazon services like Amazon Comprehend, Amazon Transcribe, and Amazon Translate, as well as your own custom machine learning workflows. To learn more, see [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#).

Select a tab in the following table to see diagrams that illustrate how Amazon A2I works with each task type. Select the task type page using the links in the preceding list to learn more about that task type.

### Amazon Textract – Key-value pair extraction

This image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

### Amazon Rekognition – Image moderation

This image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human

loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

Custom Task Type

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can access by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

## Human Review Workflow (Flow Definition)

You use a human review workflow to specify your human *work team*, to set up your worker UI using a *worker task template*, and to provide information about how workers should complete the review task.

For built-in task types, you also use the human review workflow to identify the conditions under which a human loop is initiated. For example, Amazon Rekognition can perform image content moderation using machine learning. You can use the human review workflow to specify that an image is sent to a human for content moderation review if Amazon Rekognition's confidence is too low.

You can use a human review workflow to create multiple human loops.

You can create a flow definition in the SageMaker console or with the SageMaker API. To learn more about both of these options, see [Create a Human Review Workflow \(p. 2339\)](#).

### Work Team

A *work team* is a group of human workers to whom you send your human review tasks.

When you create a human review workflow, you specify a single work team.

Your work team can come from the [Amazon Mechanical Turk workforce](#), a [vendor-managed workforce](#), or your own [private workforce](#). When you use the private workforce, you can create multiple work teams. Each work team can be used in multiple human review workflows. To learn how to create a workforce and work teams, see [Create and Manage Workforces \(p. 456\)](#).

### Worker Task Template and Human Task UI

You use a *worker task template* to create a worker UI (a *human task UI*) for your human review tasks.

The human task UI displays your input data, such as documents or images, and instructions to workers. It also provides interactive tools that the worker uses to complete your tasks.

For built-in task types, you must use the Amazon A2I worker task template provided for that task type.

## Human Loops

A *human loop* is used to create a single human review job. For each human review job, you can choose the number of workers that are sent a *task* to review a single data object. For example, if you set the number of workers per object to 3 for an image classification labeling job, three workers classify each input image. Increasing the number of workers per object can improve label accuracy.

A human loop is created using a human review workflow as follows:

- For built-in task types, the conditions specified in the human review workflow determine when the human loop is created.
- Human review tasks are sent to the work team specified in the human review workflow.
- The worker task template specified in the human review workflow is used to render the human task UI.

### When do human loops get created?

When you use one of the *built-in task types*, the corresponding Amazon service creates and starts a human loop on your behalf when the conditions specified in your human review workflow are met. For example:

- When you use Augmented AI with Amazon Textract, you can integrate Amazon A2I into a document review task using the API operation `AnalyzeDocument`. A human loop is created every time Amazon Textract returns inferences about key-value pairs that meet the conditions you specify in your human review workflow.
- When you use Augmented AI with Amazon Rekognition, you can integrate Amazon A2I into an image moderation task using the API operation `DetectModerationLabels`. A human loop is created every time Amazon Rekognition returns inferences about image content that meet the conditions you specify in your human review workflow.

When using a *custom task type*, you start a human loop using the [Amazon Augmented AI Runtime API](#). When you call `StartHumanLoop` in your custom application, a task is sent to human reviewers.

To learn how to create and start a human loop, see [Create and Start a Human Loop \(p. 2358\)](#).

To generate these resources and create a human review workflow, Amazon A2I integrates multiple APIs, including the Amazon Augmented AI Runtime Model, the SageMaker APIs, and APIs associated with your task type. To learn more, see [Use APIs in Amazon Augmented AI \(p. 2394\)](#).

**Note**

Amazon Region availability may differ when you use Augmented AI with other Amazon services, such as Amazon Textract. Create Augmented AI resources in the same Amazon Region that you use to interact with those Amazon services. For Amazon Region availability for all services, see the [Region Table](#).

## Prerequisites to Using Augmented AI

Amazon A2I uses resources in IAM, SageMaker, and Amazon S3 to create and run your human review workflows. You can create some of these resources in the Amazon A2I console when you create a human review workflow. To learn how, see [Tutorial: Get Started in the Amazon A2I Console \(p. 2314\)](#).

To use Amazon A2I, you need the following resources:

- One or more Amazon S3 buckets in the same Amazon Region as the workflow for your input and output data. To create a bucket, follow the instructions in [Create a Bucket](#) in the *Amazon Simple Storage Service Console User Guide*.
- An IAM role with required permissions to create a human review workflow and an IAM user or role with permission to access Augmented AI. For more information, see [Permissions and Security in Amazon Augmented AI \(p. 2386\)](#).
- A public, private, or vendor workforce for your human review workflows. If you plan to use a private workforce, you need to set one up ahead of time in the same Amazon Region as your Amazon A2I workflow. To learn more about these workforce types, see [Create and Manage Workforces \(p. 456\)](#).

**Important**

To learn about the compliance programs that cover Amazon Augmented AI at this time, see [Amazon Services in Scope by Compliance Program](#). If you use Amazon Augmented AI in conjunction with other Amazon services (such as Amazon Rekognition and Amazon Textract), note that Amazon Augmented AI may not be in scope for the same compliance programs as those other services. You are responsible for how you use Amazon Augmented AI, including understanding how the service processes or stores customer data and any impact on the compliance of your data environment. You should discuss your workload objectives and goals with your Amazon account team; they can help you evaluate whether the service is a good fit for your proposed use case and architecture.

## Tutorial: Get Started in the Amazon A2I Console

The following tutorial shows you how to get started using Amazon A2I in the Amazon A2I console.

The tutorial gives you the option to use Augmented AI with Amazon Textract for document review or Amazon Rekognition for image content review.

### Prerequisites

To get started using Amazon A2I, complete the following prerequisites.

- Create an Amazon S3 bucket in the same Amazon Region as the workflow for your input and output data. For example, if you are using Amazon A2I with Amazon Textract in us-east-1, create your bucket in us-east-1. To create a bucket, follow the instructions in [Create a Bucket](#) in the *Amazon Simple Storage Service Console User Guide*.
- Do one of the following:
  - If you want to complete the tutorial using Amazon Textract, download [this sample document](#) and place it in your Amazon S3 bucket.

- If you want to complete the tutorial using Amazon Rekognition, download [this image](#) and place it in your Amazon S3 bucket.

**Note**

The Amazon A2I console is embedded in the SageMaker console.

## Step 1: Create a Work Team

First, create a work team in the Amazon A2I console and add yourself as a worker so that you can preview the worker review task.

**Important**

This tutorial uses a private work team. The Amazon A2I private workforce is configured in the Ground Truth area of the SageMaker console and is shared between Amazon A2I and Ground Truth.

### To create a private workforce using worker emails

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. In the navigation pane, choose **Labeling workforces** under **Ground Truth**.
3. Choose **Private**, then choose **Create private team**.
4. Choose **Invite new workers by email**.
5. For this tutorial, enter your email and any others that you want to be able to preview the human task UI. You can paste or type a list of up to 50 email addresses, separated by commas, into the email addresses box.
6. Enter an organization name and contact email.
7. Optionally, choose an Amazon SNS topic to which to subscribe the team so workers are notified by email when new Ground Truth labeling jobs become available. Amazon SNS notifications are supported by Ground Truth and are not supported by Augmented AI. If you subscribe workers to Amazon SNS notifications, they only receive notifications about Ground Truth labeling jobs. They do not receive notifications about Augmented AI tasks.
8. Choose **Create private team**.

If you add yourself to a private work team, you receive an email from `no-reply@verificationemail.com` with login information. Use the link in this email to reset your password and log in to your worker portal. This is where your human review tasks appear when you create a human loop.

## Step 2: Create a Human Review Workflow

In this step, you create a human review workflow. Each human review workflow is created for a specific [task type](#). This tutorial allows you to choose between the built-in task types: Amazon Rekognition and Amazon Textract.

### To create a human review workflow:

1. Open the Augmented AI console at <https://console.amazonaws.cn/a2i> to access the **Human review workflows** page.
2. Select **Create human review workflow**.
3. In **Workflow settings**, enter a workflow **Name**, **S3 bucket**, and the **IAM role** that you created for this tutorial, with the Amazon managed policy `AmazonAugmentedAIIntegratedAPIAccess` attached.
4. For **Task type**, select **Textract – Key-value pair extraction** or **Rekognition – Image moderation**.
5. Select the task type that you chose from the following table for instructions for that task type.

#### Amazon Textract – Key-value pair extraction

1. Select **Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing.**
2. For **Key name**, enter **Mail Address**.
3. Set the identification confidence threshold between 0 and 99.
4. Set the qualification confidence threshold between 0 and 99.
5. Select **Trigger a human review for all form keys identified by Amazon Textract with confidence scores in a specific range.**
6. Set the identification confidence threshold between 0 and 90.
7. Set the qualification confidence threshold between 0 and 90.

This initiates a human review if Amazon Textract returns a confidence score that is less than 99 for **Mail Address** and its key, or if it returns a confidence score less than 90 for any key value pair detected in the document.

The following image shows the Amazon Textract form extraction - Conditions for invoking human review section of the Amazon A2I console. In the image, the check boxes for the two types of triggers explained in the proceeding paragraph are checked, and **Mail Address** is used as a **Key name** for the first trigger. The identification confidence threshold is defined using confidence scores for key-value pairs detect within the form and is set between 0 and 99. The qualification confidence threshold is defined using confidence scores for text contained within keys and values in a form and is set between 0 and 99.

**Amazon Textract form extraction - Conditions for invoking human review**

When Amazon Textract extracts information from a document, it returns a confidence score. You can use these confidence scores to define business conditions that trigger human review.

**Identification confidence**  
The confidence score for key-value pairs detected within a form.

**Qualification confidence**  
The confidence score for text contained within key and value in a form.

You can define a range for identification confidence and qualification confidence thresholds. A human review will be triggered when the confidence score falls within the defined range.

[Learn more about using Amazon Augmented AI with Amazon Textract](#)

Trigger a human review for specific form keys based on the form key confidence score or when specific form keys are missing. The form key and value will be sent to the human review.

**Key name**  
  
Trigger human review when this form key is missing,  
or when its identification confidence threshold is between  and   
or when its qualification confidence threshold is between  and   
[Add key](#)

Trigger human review for all form keys identified by Amazon Textract with confidence scores in a specified range. The form key and value will be sent to the human review.

**Identification confidence threshold**  
Trigger human review for key-value pairs detected within a form whose confidence score is in the following range:  
  and   
Minimum value is 0. Maximum value is 100.  
**Qualification confidence threshold**  
Trigger human review when the total confidence within key-value pairs in a form has confidence scores in the following range:  
  and   
Minimum value is 0. Maximum value is 100.  
 Randomly send a sample of forms to humans for review.  
For each form sent, all key-value pairs identified by Amazon Textract for that form will be sent for human review.

### Amazon Rekognition – Image moderation

1. Select **Trigger human review for labels identified by Amazon Rekognition based on label confidence score**.

2. Set the **Threshold** between 0 and 98.

This initiates a human review if Amazon Rekognition returns a confidence score that is less than 98 for an image moderation job.

The following image shows how you can select the **Trigger human review for labels identified by Amazon Rekognition based on label confidence score** option and enter a **Threshold** between 0 and 98 in the Amazon A2I console.

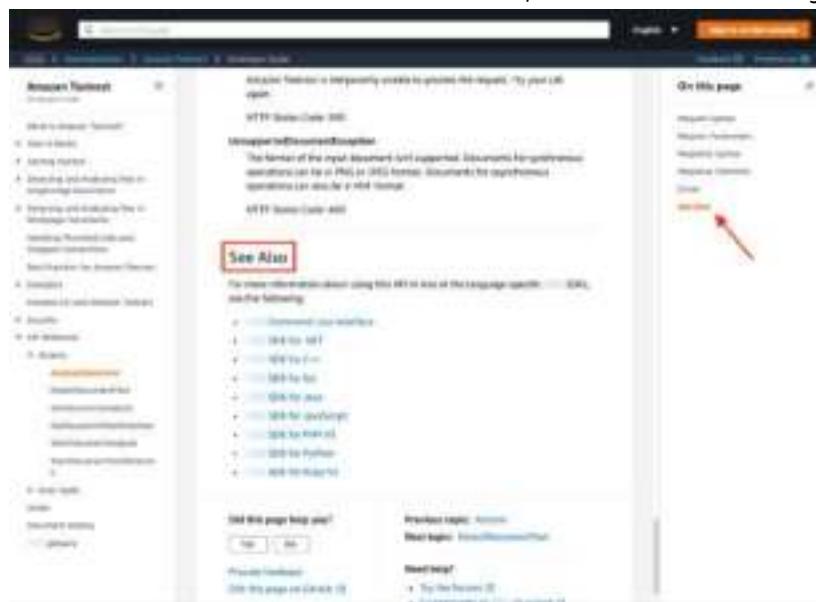

6. Under **Worker task template creation**, select **Create from a default template**.
7. Enter a **Template name**.
8. In **Task description** field, enter the following text:

Read the instructions carefully and complete the task.
9. Under **Workers**, select **Private**.
10. Select the private team that you created.
11. Choose **Create**.

Once your human review workflow is created, it appears in the table on the **Human review workflows** page. When the **Status** is **Active**, copy and save the Workflow ARN. You need it for the next step.

## Step 3: Start a Human Loop

You must use an API operation to start a human loop. There are a variety of language-specific SDKs that you can use to interact with these API operations. To see documentation for each of these SDKs, refer to the **See Also** section in the API documentation, as shown in the following image.

For this tutorial, you use one of the following APIs:

- If you chose the Amazon Textract task type, you use the [AnalyzeDocument](#) operation.
- If you chose the Amazon Rekognition task type, you use the [DetectModerationLabels](#) operation.

You can interact with these APIs using a SageMaker notebook instance (recommended for new users) or the Amazon Command Line Interface (Amazon CLI). Choose one of the following to learn more about these options:

- To learn more about and set up a notebook instance, see [Use Amazon SageMaker Notebook Instances \(p. 120\)](#).
- To learn more about and get started using the Amazon CLI, see [What Is the Amazon Command Line Interface?](#) in the *Amazon Command Line Interface User Guide*.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the Amazon SDK for Python (Boto3).

#### Amazon Textract – Key-value pair extraction

The following example uses the Amazon SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [analyze\\_document](#) documentation in the *Amazon SDK for Python (Boto) API Reference*.

```
response = client.analyze_document(
    Document={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "document-name.pdf"
        }
    },
    HumanLoopConfig={
        "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation" | "FreeOfAdultContent"
            ]
        },
        FeatureTypes=[ "TABLES", "FORMS" ]
    }
)
```

#### Amazon Rekognition – Image moderation

The following example uses the Amazon SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [detect\\_moderation\\_labels](#) documentation in the *Amazon SDK for Python (Boto) API Reference*.

```
response = client.detect_moderation_labels(
    Image={
        "S3Object": {
            "Bucket": "AWSDOC-EXAMPLE-BUCKET",
            "Name": "image-name.png"
        }
    },
    HumanLoopConfig={
        "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
        "HumanLoopName": "human-loop-name",
        "DataAttributes": {
            "ContentClassifiers": [
                "FreeOfPersonallyIdentifiableInformation" | "FreeOfAdultContent"
            ]
        }
    }
)
```

```
}
```

## Step 4: View Human Loop Status in Console

When you start a human loop, you can view its status in the Amazon A2I console.

### To view your human loop status

1. Open the Augmented AI console at <https://console.amazonaws.cn/a2i> to access the **Human review workflows** page.
2. Select the human review workflow that you used to start your human loop.
3. In the **Human loops** section, you can see your human loop. View its status in the **Status** column.

## Step 5: Download Output Data

Your output data is stored in the Amazon S3 bucket you specified when you created a human review workflow.

### To view your Amazon A2I output data

1. Open the [Amazon S3 console](#).
2. Select the Amazon S3 bucket you specified when you created your human review workflow in step 2 of this example.
3. Starting with the folder that is named after your human review workflow, navigate to your output data by selecting the folder with the following naming convention:

```
s3://output-bucket-specified-in-human-review-workflow/human-review-workflow-
name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

4. Select `output.json` and choose **Download**.

## Tutorial: Get Started Using the Amazon A2I API

This tutorial explains the API operations you can use to get started using Amazon A2I.

To use a Jupyter Notebook to run these operations, select a Jupyter Notebook from [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#) and use [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook \(p. 2332\)](#) to learn how to use it in a SageMaker notebook instance.

To learn more about the API operations you can use with Amazon A2I, see [Use APIs in Amazon Augmented AI \(p. 2394\)](#).

## Create a Private Work Team

You can create a private work team and add yourself as a worker so that you can preview Amazon A2I.

If you are not familiar with Amazon Cognito, we recommend that you use the SageMaker console to create a private workforce and add yourself as a private worker. For instructions, see [Step 1: Create a Work Team \(p. 2315\)](#).

If you are familiar with Amazon Cognito, you can use the following instructions to create a private work team using the SageMaker API. After you create a work team, note the work team ARN (`workteamArn`).

To learn more about the private workforce and other available configurations, see [Use a Private Workforce \(p. 461\)](#).

### Create a private workforce

If you have not created a private workforce, you can do so using an [Amazon Cognito user pool](#). Make sure that you have added yourself to this user pool. You can create a private work team using the Amazon SDK for Python (Boto3) `create_workforce` function. For other language-specific SDKs, refer to the list in [CreateWorkforce](#).

```
response = client.create_workforce(  
    CognitoConfig={  
        "UserPool": "Pool_ID",  
        "ClientId": "app-client-id"  
    },  
    WorkforceName="workforce-name"  
)
```

### Create a private work team

After you have created a private workforce in the Amazon Region to configure and start your human loop, you can create a private work team using the Amazon SDK for Python (Boto3) `create_workteam` function. For other language-specific SDKs, refer to the list in [CreateWorkteam](#).

```
response = client.create_workteam(  
    WorkteamName="work-team-name",  
    WorkforceName= "workforce-name",  
    MemberDefinitions=[  
        {  
            "CognitoMemberDefinition": {  
                "UserPool": "<aws-region>_ID",  
                "UserGroup": "user-group",  
                "ClientId": "app-client-id"  
            },  
        }  
    ]  
)
```

Access your work team ARN as follows:

```
workteamArn = response[ "WorkteamArn" ]
```

### List private work teams in your account

If you have already created a private work team, you can list all work teams in a given Amazon Region in your account using the Amazon SDK for Python (Boto3) `list_workteams` function. For other language-specific SDKs, refer to the list in [ListWorkteams](#).

```
response = client.list_workteams()
```

If you have numerous work teams in your account, you may want to use `MaxResults`, `SortBy`, and `NameContains` to filter your results.

## Create a Human Review Workflow

You can create a human review workflow using the Amazon A2I [CreateFlowDefinition](#) operation. Before you create your human review workflow, you need to create a human task UI. You can do this with the [CreateHumanTaskUi](#) operation.

If you are using Amazon A2I with the Amazon Textract or Amazon Rekognition integrations, you can specify activation conditions using a JSON.

### Create a Human Task UI

If you are creating a human review workflow to be used with Amazon Textract or Amazon Rekognition integrations, you need to use and modify pre-made worker task template. For all custom integrations, you can use your own custom worker task template. Use the following table to learn how to create a human task UI using a worker task template for the two built-in integrations. Replace the template with your own to customize this request.

Amazon Textract – Key-value pair extraction

To learn more about this template, see [Custom Template Example for Amazon Textract \(p. 2369\)](#).

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}
<crowd-form>
    <crowd-textract-analyze-document
        src="{{ s3_uri | grant_read_access }}"
        initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
        header="Review the key-value pairs listed on the right and correct them if they
don't match the following document."
        no-key-edit=""
        no-geometry-edit=""
        keys="{{ task.input.humanLoopContext.importantFormKeys }}"
        block-types='["KEY_VALUE_SET"]'
        <short-instructions header="Instructions">
            <p>Click on a key-value block to highlight the corresponding key-value pair in
the document.
            </p><p><br></p>
            <p>If it is a valid key-value pair, review the content for the value. If the
content is incorrect, correct it.
            </p><p><br></p>
            <p>The text of the value is incorrect, correct it.</p>
            <p>
            </p><p><br></p>
            <p>A wrong value is identified, correct it.</p>
            <p>
            </p><p><br></p>
            <p>If it is not a valid key-value relationship, choose No.</p>
            <p>
            </p><p><br></p>
            <p>If you can't find the key in the document, choose Key not found.</p>
            <p>
            </p><p><br></p>
            <p>If the content of a field is empty, choose Value is blank.</p>
            <p>
            </p><p><br></p>
            <p><strong>Examples</strong></p>
            <p>Key and value are often displayed next or below to each other.
            </p><p><br></p>
```

```

<p>Key and value displayed in one line.</p>
<p>
</p><p><br></p>
<p>Key and value displayed in two lines.</p>
<p>
</p><p><br></p>
<p>If the content of the value has multiple lines, enter all the text without
line break.
Include all value text even if it extends beyond the highlight box.</p>
<p></
p>
</short-instructions>
<full-instructions header="Instructions"></full-instructions>
</crowd-extract-analyze-document>
</crowd-form>
"""

```

### Amazon Rekognition – Image moderation

To learn more about this template, see [Custom Template Example for Amazon Rekognition \(p. 2371\)](#).

```

template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{# capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
      {% endfor %}
    ]'
    src="{{ s3_uri | grant_read_access }}"
    header="Review the image and choose all applicable categories."
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
      </style>
      <p class="instructions">Review the image and choose all applicable categories.
      If no categories apply, choose None.
      </p>
    </short-instructions>
    <b>Nudity</b>
    Visuals depicting nude male or female person or persons

    <b>Partial Nudity</b>
    Visuals depicting covered up nudity, for example using hands or pose

    <b>Revealing Clothes</b>
    Visuals depicting revealing clothes and poses

    <b>Physical Violence</b>
    Visuals depicting violent physical assault, such as kicking or punching

    <b>Weapon Violence</b>

```

```
Visuals depicting violence using weapons like firearms or blades, such as shooting
<b>Weapons</b>
Visuals depicting weapons like firearms and blades
</short-instructions>

<full-instructions header="Instructions"></full-instructions>
</crowd-rekognition-detect-moderation-labels>
</crowd-form>""
```

## Custom Integration

The following is an example template that can be used in a custom integration. This template is used in this [notebook](#), demonstrating a custom integration with Amazon Comprehend.

```
template = r"""
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>

<crowd-form>
    <crowd-classifier
        name="sentiment"
        categories='["Positive", "Negative", "Neutral", "Mixed"]'
        initial-value="{{ task.input.initialValue }}"
        header="What sentiment does this text convey?"
    >
        <classification-target>
            {{ task.input.taskObject }}
        </classification-target>

        <full-instructions header="Sentiment Analysis Instructions">
            <p><strong>Positive</strong> sentiment include: joy, excitement, delight</p>
            <p><strong>Negative</strong> sentiment include: anger, sarcasm, anxiety</p>
            <p><strong>Neutral</strong>: neither positive or negative, such as stating a fact</p>
            <p><strong>Mixed</strong>: when the sentiment is mixed</p>
        </full-instructions>

        <short-instructions>
            Choose the primary sentiment that is expressed by the text.
        </short-instructions>
    </crowd-classifier>
</crowd-form>
"""
```

Using the template specified above, you can create a template using the Amazon SDK for Python (Boto3) [create\\_human\\_task\\_ui](#) function. For other language-specific SDKs, refer to the list in [CreateHumanTaskUi](#).

```
response = client.create_human_task_ui(
    HumanTaskUiName="human-task-ui-name",
    UiTemplate={
        "Content": template
    }
)
```

This response element contains the human task UI ARN. Save this as follows:

```
humanTaskUiArn = response["HumanTaskUiArn"]
```

## Create JSON to specify activation conditions

For Amazon Textract and Amazon Rekognition built-in integrations, you can save activation conditions in a JSON object and use this in your `CreateFlowDefinition` request.

Next, select a tab to see example activation conditions you can use for these built-in integrations. For additional information about activation condition options, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI \(p. 2345\)](#).

### Amazon Textract – Key-value pair extraction

This example specifies conditions for specific keys (such as `Mail address`) in the document. If Amazon Textract's confidence falls outside of the thresholds set here, the document is sent to a human for review, with the specific keys that initiated the human loop prompted to the worker.

```
import json

humanLoopActivationConditions = json.dumps(
    {
        "Conditions": [
            {
                "Or": [
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:", "Mail address:", "Mailing Add:", "Mailing Addresses"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "MissingImportantFormKey",
                        "ConditionParameters": {
                            "ImportantFormKey": "Mail address",
                            "ImportantFormKeyAliases": ["Mail Address:", "Mail address:", "Mailing Add:", "Mailing Addresses"]
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "Phone Number",
                            "ImportantFormKeyAliases": ["Phone number:", "Phone No.:",
                                "Number:"],
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "*",
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    },
                    {
                        "ConditionType": "ImportantFormKeyConfidenceCheck",
                        "ConditionParameters": {
                            "ImportantFormKey": "*",
                            "KeyValueBlockConfidenceLessThan": 100,
                            "WordBlockConfidenceLessThan": 100
                        }
                    }
                ]
            }
        ]
    }
)
```

```

        "KeyValueBlockConfidenceGreaterThanOrEqual": 0,
        "WordBlockConfidenceGreaterThanOrEqual": 0
    }
}
]
}
)

```

#### Amazon Rekognition – Image moderation

The human loop activation conditions used here are tailored towards Amazon Rekognition content moderation; they are based on the confidence thresholds for the `Suggestive` and `Female Swimwear Or Underwear` moderation labels.

```

import json

humanLoopActivationConditions = json.dumps(
{
    "Conditions": [
        {
            "Or": [
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Suggestive",
                        "ConfidenceLessThan": 98
                    }
                },
                {
                    "ConditionType": "ModerationLabelConfidenceCheck",
                    "ConditionParameters": {
                        "ModerationLabelName": "Female Swimwear Or Underwear",
                        "ConfidenceGreaterThanOrEqual": 98
                    }
                }
            ]
        }
    ]
}
)

```

## Create a human review workflow

This section gives an example of the `CreateFlowDefinition` Amazon SDK for Python (Boto3) request using the resources created in the previous sections. For other language-specific SDKs, refer to the list in [CreateFlowDefinition](#). Use the tabs in the following table to see the requests to create a human review workflow for Amazon Textract and Amazon Rekognition built-in integrations.

#### Amazon Textract – Key-value pair extraction

If you use the built-in integration with Amazon Textract, you must specify "AWS/Textract/AnalyzeDocument/Forms/V1" for "AwsManagedHumanLoopRequestSource" in `HumanLoopRequestSource`.

```

response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={

```

```

        "AwsManagedHumanLoopRequestSource": "AWS/Texttract/AnalyzeDocument/Forms/V1"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Document entry review",
        "TaskDescription": "Review the document and instructions. Complete the
task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "document review",
        ],
    },
    OutputConfig={
        "S3OutputPath": "s3://prefix/",
    },
    RoleArn="arn:aws:iam:<account-number>:role/<role-name>",
    Tags=[
        {
            "Key": "string",
            "Value": "string"
        },
    ],
)

```

#### Amazon Rekognition – Image moderation

If you use the built-in integration with Amazon Rekognition, you must specify "AWS/Rekognition/DetectModerationLabels/Image/V3" for "AwsManagedHumanLoopRequestSource" in HumanLoopRequestSource.

```

response = client.create_flow_definition(
    FlowDefinitionName="human-review-workflow-name",
    HumanLoopRequestSource={
        "AwsManagedHumanLoopRequestSource": "AWS/Rekognition/
DetectModerationLabels/Image/V3"
    },
    HumanLoopActivationConfig={
        "HumanLoopActivationConditionsConfig": {
            "HumanLoopActivationConditions": humanLoopActivationConditions
        }
    },
    HumanLoopConfig={
        "WorkteamArn": workteamArn,
        "HumanTaskUiArn": humanTaskUiArn,
        "TaskTitle": "Image content moderation",
        "TaskDescription": "Review the image and instructions. Complete the task",
        "TaskCount": 1,
        "TaskAvailabilityLifetimeInSeconds": 43200,
        "TaskTimeLimitInSeconds": 3600,
        "TaskKeywords": [
            "content moderation",
        ],
    },
    OutputConfig={
        "S3OutputPath": "s3://prefix/",
    }
)

```

```
        },
        RoleArn="arn:aws:iam::<account-number>:role/<role-name>",
        Tags=[  
            {  
                "Key": "string",  
                "Value": "string"  
            },  
        ]  
    )
```

## Custom Integration

If you use a custom integration, exclude the following parameters: `HumanLoopRequestSource`, `HumanLoopActivationConfig`.

```
response = client.create_flow_definition(  
    FlowDefinitionName="human-review-workflow-name",  
    HumanLoopConfig={  
        "WorkteamArn": workteamArn,  
        "HumanTaskUiArn": humanTaskUiArn,  
        "TaskTitle": "Image content moderation",  
        "TaskDescription": "Review the image and instructions. Complete the task",  
        "TaskCount": 1,  
        "TaskAvailabilityLifetimeInSeconds": 43200,  
        "TaskTimeLimitInSeconds": 3600,  
        "TaskKeywords": [  
            "content moderation",  
        ],  
    },  
    OutputConfig={  
        "S3OutputPath": "s3://prefix/",  
    },  
    RoleArn="arn:aws:iam::<account-number>:role/<role-name>",  
    Tags=[  
        {  
            "Key": "string",  
            "Value": "string"  
        },  
    ]  
)
```

After you create a human review workflow, you can retrieve the flow definition ARN from the response:

```
humanReviewWorkflowArn = response["FlowDefinitionArn"]
```

## Create a Human Loop

The API operation you use to start a human loop depends on the Amazon A2I integration you use.

- If you use the Amazon Textract built-in integration, you use the [AnalyzeDocument](#) operation.
- If you use the Amazon Rekognition built-in integration, you use the [DetectModerationLabels](#) operation.
- If you use a custom integration, you use the [StartHumanLoop](#) operation.

Select your task type in the following table to see example requests for Amazon Textract and Amazon Rekognition using the Amazon SDK for Python (Boto3).

### Amazon Textract – Key-value pair extraction

The following example uses the Amazon SDK for Python (Boto3) to call `analyze_document` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `analyze_document` documentation in the *Amazon SDK for Python (Boto) API Reference*.

```
response = client.analyze_document(
    Document={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "document-name.pdf"},
              "HumanLoopConfig={"
                "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-definition/flow-definition-name",
                "HumanLoopName": "human-loop-name",
                "DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation"] | ["FreeOfAdultContent"]}
              }
              FeatureTypes=[ "FORMS" ]
            )
```

Human loops are only created if Amazon Textract's confidence for document analysis task meets the activation conditions you specified in your human review workflow. You can check the `response` element to determine if a human loop has been created. To see everything included in this response, see [HumanLoopActivationOutput](#).

```
if "HumanLoopArn" in analyzeDocumentResponse["HumanLoopActivationOutput"]:
    # A human loop has been started!
    print(f"A human loop has been started with ARN:
{analyzeDocumentResponse["HumanLoopActivationOutput"]["HumanLoopArn"]}"")
```

### Amazon Rekognition – Image moderation

The following example uses the Amazon SDK for Python (Boto3) to call `detect_moderation_labels` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the `detect_moderation_labels` documentation in the *Amazon SDK for Python (Boto) API Reference*.

```
response = client.detect_moderation_labels(
    Image={"S3Object": {"Bucket": "AWSDOC-EXAMPLE-BUCKET", "Name": "image-name.png"}},
              "HumanLoopConfig={"
                "FlowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-definition/flow-definition-name",
                "HumanLoopName": "human-loop-name",
                "DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation"] | ["FreeOfAdultContent"]}
              }
            )
```

Human loops are only created if Amazon Rekognition's confidence for an image moderation task meets the activation conditions you specified in your human review workflow. You can check the `response` element to determine if a human loop has been created. To see everything included in this response, see [HumanLoopActivationOutput](#).

```
if "HumanLoopArn" in response["HumanLoopActivationOutput"]:
```

```

# A human loop has been started!
print(f"A human loop has been started with ARN:
{response[ "HumanLoopActivationOutput" ][ "HumanLoopArn" ]}")

```

### Custom Integration

The following example uses the Amazon SDK for Python (Boto3) to call `start_human_loop` in us-west-2. Replace the italicized red text with your resources. Include the `DataAttributes` parameter if you are using the Amazon Mechanical Turk workforce. For more information, see the [start\\_human\\_loop](#) documentation in the *Amazon SDK for Python (Boto) API Reference*.

```

response = client.start_human_loop(
    HumanLoopName= "human-loop-name",
    FlowDefinitionArn= "arn:aws:sagemaker:us-west-2:111122223333:flow-definition/
flow-definition-name",
    HumanLoopInput={"InputContent": inputContentJson},
    DataAttributes={"ContentClassifiers":
        [ "FreeOfPersonallyIdentifiableInformation" | "FreeOfAdultContent" ]
    }
)

```

This example stores input content in the variable `inputContentJson`. Assume that the input content contains two elements: a text blurb and sentiment (such as Positive, Negative, or Neutral), and it is formatted as follows:

```

inputContent = {
    "initialValue": sentiment,
    "taskObject": blurb
}

```

The keys `initialValue` and `taskObject` must correspond to the keys used in the liquid elements of the worker task template. Refer to the custom template in [Create a Human Task UI \(p. 2322\)](#) to see an example.

To create `inputContentJson`, do the following:

```

import json

inputContentJson = json.dumps(inputContent)

```

A human loop starts each time you call `start_human_loop`. To check the status of your human loop, use `describe_human_loop`:

```

human_loop_info = a2i.describe_human_loop(HumanLoopName="human-loop-name")
print(f"HumanLoop Status: {resp[ "HumanLoopStatus" ]}")
print(f"HumanLoop Output Destination: {resp[ "HumanLoopOutput" ]}")

```

## Use Cases and Examples Using Amazon A2I

You can use Amazon Augmented AI to incorporate a human review into your workflow for *built-in task types*, Amazon Textract and Amazon Rekognition, or your own custom tasks using a *custom task type*.

When you create a human review workflow using one of the built-in task types, you can specify conditions, such as confidence thresholds, that initiate a human review. The service (Amazon Rekognition

or Amazon Textract) creates a human loop on your behalf when these conditions are met and supplies your input data directly to Amazon A2I to send to human reviewers. To learn more about the built-in task types, use the following:

- [Use Amazon Augmented AI with Amazon Textract \(p. 2332\)](#)
- [Use Amazon Augmented AI with Amazon Rekognition \(p. 2335\)](#)

When you use a custom task type, you create and start a human loop using the Amazon A2I Runtime API. Use the custom task type to incorporate a human review workflow with other Amazon services or your own custom ML application.

- For more details, see [Use Amazon Augmented AI with Custom Task Types \(p. 2337\)](#)

The following table outlines a variety of Amazon A2I use cases that you can explore using SageMaker Jupyter Notebooks. To get started with a Jupyter Notebook, use the instructions in [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook \(p. 2332\)](#). For more examples, see this [GitHub repository](#).

Use Case	Description	Task Type
<a href="#">Use Amazon A2I with Amazon Textract</a>	Have humans review single-page documents to review important form key-value pairs, or have Amazon Textract randomly sample and send documents from your dataset to humans for review.	Built-in
<a href="#">Use Amazon A2I with Amazon Rekognition</a>	Have humans review unsafe images for explicit adult or violent content if Amazon Rekognition returns a low confidence score, or have Amazon Rekognition randomly sample and send images from your dataset to humans for review.	Built-in
<a href="#">Use Amazon A2I with Amazon Comprehend</a>	Have humans review Amazon Comprehend inferences about text data such as sentiment analysis, text syntax, and entity detection.	Custom
<a href="#">Use Amazon A2I with Amazon Transcribe</a>	Have humans review Amazon Transcribe transcriptions of video or audio files. Use the results of transcription human review loops to create a custom vocabulary and improve future transcriptions of similar video or audio content.	Custom
<a href="#">Use Amazon A2I with Amazon Translate</a>	Have humans review low-confidence translations returned from Amazon Translate.	Custom

Use Case	Description	Task Type
Use Amazon A2I to review real-time ML inferences	Use Amazon A2I to review real-time, low-confidence inferences made by a model deployed to a SageMaker hosted endpoint and incrementally train your model using Amazon A2I output data.	Custom
Use Amazon A2I to review tabular data	Use Amazon A2I to integrate a human review loop into an ML application that uses tabular data.	Custom

#### Topics

- [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook \(p. 2332\)](#)
- [Use Amazon Augmented AI with Amazon Textract \(p. 2332\)](#)
- [Use Amazon Augmented AI with Amazon Rekognition \(p. 2335\)](#)
- [Use Amazon Augmented AI with Custom Task Types \(p. 2337\)](#)

## Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook

For an end-to-end example that demonstrates how to integrate an Amazon A2I human review loop into a machine learning workflow, you can use a Jupyter Notebook from this [GitHub Repository](#) in a SageMaker notebook instance.

#### To use an Amazon A2I custom task type sample notebook in an Amazon SageMaker notebook instance:

1. If you do not have an active SageMaker notebook instance, create one by following the instructions in [Step 1: Create an Amazon SageMaker Notebook Instance \(p. 53\)](#).
2. When your notebook instance is active, choose **Open JupyterLab** to the right of the notebook instance's name. It may take a few moments for JupyterLab to load.
3. Choose the  icon to clone a GitHub repository into your workspace.
4. Enter the [amazon-a2i-sample-jupyter-notebooks](#) repository HTTPS URL.
5. Choose **CLONE**.
6. Open the notebook that you would like to run.
7. Follow the instructions in the notebook to configure your human review workflow and human loop and run the cells.
8. To avoid incurring unnecessary charges, when you are done with the demo, stop and delete your notebook instance in addition to any Amazon S3 buckets, IAM roles, and CloudWatch Events resources created during the walkthrough.

## Use Amazon Augmented AI with Amazon Textract

Amazon Textract enables you to add document text detection and analysis to your applications. Amazon Augmented AI (Amazon A2I) directly integrates with Amazon Textract's AnalyzeDocument API

operation. You can use `AnalyzeDocument` to analyze a document for relationships between detected items. When you add an Amazon A2I human review loop to an `AnalyzeDocument` request, Amazon A2I monitors the Amazon Textract results and sends a document to one or more human workers for review when the conditions specified in your flow definition are met. For example, if you want a human to review a specific key like `Full_name:` and their associated input values, you can create an activation condition that starts a human review any time the `Full_name:` key is detected or when the inference confidence for that key falls within a range that you specify.

The following image depicts the Amazon A2I built-in workflow with Amazon Textract. On the left, the resources that are required to create an Amazon Textract human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Textract to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can specify when Amazon Textract sends a task to a human worker for review when creating a human review workflow or flow definition by specifying *activation conditions*.

You can set the following activation conditions when using the Amazon Textract task type:

- Initiate a human review for specific form keys based on the form key confidence score.
- Initiate a human review when specific form keys are missing.
- Initiate human review for all form keys identified by Amazon Textract with confidence scores in a specified range.
- Randomly send a sample of forms to humans for review.

When your activation condition depends on form key confidence scores, you can use two types of prediction confidence to initiate human loops:

- **Identification confidence** – The confidence score for key-value pairs detected within a form.
- **Qualification confidence** – The confidence score for text contained within key and value in a form.

In the image in the following section, **Full Name: Jane Doe** is the key-value pair, **Full Name** is the key, and **Jane Doe** is the value.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of `CreateFlowDefinition` API operation. To learn how specify activation conditions in JSON format, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI \(p. 2345\)](#) and [Use Human Loop Activation Conditions JSON Schema with Amazon Textract \(p. 2347\)](#).

**Note**

When using Augmented AI with Amazon Textract, create Augmented AI resources in the same Amazon Region you use to call `AnalyzeDocument`.

## Get Started: Integrate a Human Review into an Amazon Textract Analyze Document Job

To integrate a human review into an Amazon Textract text detection and analysis job, you need to create a flow definition, and then use the Amazon Textract API to integrate that flow definition into your workflow. To learn how to create a flow definition using the SageMaker console or Augmented AI API, see the following topics:

- [Create a Human Review Workflow \(Console\) \(p. 2340\)](#)
- [Create a Human Review Workflow \(API\) \(p. 2341\)](#)

After you've created your flow definition, see [Using Augmented AI with Amazon Textract](#) to learn how to integrate your flow definition into your Amazon Textract task.

## End-to-End Example Using Amazon Textract and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Textract with Amazon A2I using the console, see [Tutorial: Get Started in the Amazon A2I Console \(p. 2314\)](#).

To learn how to use the Amazon A2I API to create and start a human review, you can use [Amazon Augmented AI \(Amazon A2I\) integration with Amazon Textract's Analyze Document \[Example\]](#) in a SageMaker Notebook instance. To get started, see [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook \(p. 2332\)](#).

## A2I Textract Worker Console Preview

When they're assigned a review task in an Amazon Textract workflow, workers might see a user interface similar to the following:

You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see [Create and Manage Worker Task Templates \(p. 2366\)](#).

## Use Amazon Augmented AI with Amazon Rekognition

Amazon Rekognition makes it easy to add image analysis to your applications. The Amazon Rekognition DetectModerationLabels API operation is directly integrated with Amazon A2I so that you can easily create a human loop to review unsafe images, such as explicit adult or violent content. You can use DetectModerationLabels to configure a human loop using a flow definition ARN. This enables Amazon A2I to analyze predictions made by Amazon Rekognition and send results to a human for review to ensure they meet the conditions set in your flow definition.

The following image depicts the Amazon A2I built-in workflow with Amazon Rekognition. On the left, the resources that are required to create an Amazon Rekognition human review workflow are depicted: an Amazon S3 bucket, activation conditions, a worker task template, and a work team. These resources are used to create a human review workflow, or flow definition. An arrow points right to the next step in the workflow: using Amazon Rekognition to configure a human loop with the human review workflow. A second arrow points right from this step to the step in which activation conditions specified in the human review workflow are met. This initiates the creation of a human loop. On the right of the image, the human loop is depicted in three steps: 1) the worker UI and tools are generated and the task is made available to workers, 2) workers review input data, and finally, 3) results are saved in Amazon S3.

You can set the following activation conditions when using the Amazon Rekognition task type:

- Initiate human review for labels identified by Amazon Rekognition based on the label confidence score.
- Randomly send a sample of images to humans for review.

You can set these activation conditions using the Amazon SageMaker console when you create a human review workflow, or by creating a JSON for human loop activation conditions and specifying this as input in the `HumanLoopActivationConditions` parameter of the `CreateFlowDefinition` API operation. To learn how specify activation conditions in JSON format, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI \(p. 2345\)](#) and [Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition \(p. 2353\)](#).

**Note**

When using Augmented AI with Amazon Rekognition, create Augmented AI resources in the same Amazon Region you use to call `DetectModerationLabels`.

## Get Started: Integrate a Human Review into an Amazon Rekognition Image Moderation Job

To integrate a human review into an Amazon Rekognition, see the following topics:

- [Create a Human Review Workflow \(Console\) \(p. 2340\)](#)
- [Create a Human Review Workflow \(API\) \(p. 2341\)](#)

After you've created your flow definition, see [Using Augmented AI with Amazon Rekognition](#) to learn how to integrate your flow definition into your Amazon Rekognition task.

## End-to-end Demo Using Amazon Rekognition and Amazon A2I

For an end-to-end example that demonstrates how to use Amazon Rekognition with Amazon A2I using the console, see [Tutorial: Get Started in the Amazon A2I Console \(p. 2314\)](#).

To learn how to use the Amazon A2I API to create and start a human review, you can use [Amazon Augmented AI \(Amazon A2I\) integration with Amazon Rekognition \[Example\]](#) in a SageMaker notebook instance. To get started, see [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook \(p. 2332\)](#).

## A2I Rekognition Worker Console Preview

When they're assigned a review task in an Amazon Rekognition workflow, workers might see a user interface similar to the following:

You can customize this interface in the SageMaker console when you create your human review definition, or by creating and using a custom template. To learn more, see [Create and Manage Worker Task Templates \(p. 2366\)](#).

## Use Amazon Augmented AI with Custom Task Types

You can use Amazon Augmented AI (Amazon A2I) to incorporate a human review (human loop) into *any* machine learning workflow using the *custom task type*. This option gives you the most flexibility to customize the conditions under which your data objects are sent to humans for review, as well as the look and feel of your worker user interface.

When you use a custom task type, you create a custom human review workflow and specify the conditions under which a data object is sent for human review directly in your application.

The following image depicts the Amazon A2I custom workflow. A custom ML model is used to generate predictions. The client application filters these predictions using user-defined criteria and determines if a human review is required. If so, these predictions are sent to Amazon A2I for human review. Amazon A2I collects the results of human review in Amazon S3, which can be accessed by the client application. If the filter determines that no human review is needed, predictions can be fed directly to the client application.

Use the procedures on this page to learn how to integrate Amazon A2I into any machine learning workflow using the custom task type.

### Create a human loop using a flow definition, integrate it into your application, and monitor the results

1. Complete the Amazon A2I [Prerequisites to Using Augmented AI \(p. 2314\)](#). Note the following:
  - The path to the Amazon Simple Storage Service (Amazon S3) bucket or buckets where you store your input and output data.
  - The Amazon Resource Name (ARN) of an Amazon Identity and Access Management (IAM) role with required permissions attached.
  - (Optional) The ARN of your private workforce, if you plan to use one.
2. Using HTML elements, create a custom worker template which Amazon A2I uses to generate your worker task UI. To learn how to create a custom template, see [Create Custom Worker Task Templates \(p. 2368\)](#).
3. Use the custom worker template from step 2 to generate a worker task template in the Amazon SageMaker console. To learn how, see [Create a Worker Task Template \(p. 2367\)](#).

In the next step, you create a flow definition:

4. If you want to create a flow definition using the SageMaker API, note the ARN of this worker task template for the next step.
5. If you are creating a flow definition using the console, your template automatically appears in **Worker task template** section when you choose **Create human review workflow**.
6. When creating your flow definition, provide the path to your S3 buckets, your IAM role ARN, and your worker template.
  - To learn how to create a flow definition using the SageMaker `CreateFlowDefinition` API, see [Create a Human Review Workflow \(API\) \(p. 2341\)](#).
  - To learn how to create a flow definition using the SageMaker console, see [Create a Human Review Workflow \(Console\) \(p. 2340\)](#).
7. Configure your human loop using the [Amazon A2I Runtime API](#). To learn how, see [Create and Start a Human Loop \(p. 2358\)](#).
8. To control when human reviews are initiated in your application, specify conditions under which `StartHumanLoop` is called in your application. Human loop activation conditions, such as

confidence thresholds that initiate the human loop, are not available when using Amazon A2I with custom task types. Every `StartHumanLoop` invocation results in a human review.

Once you have started a human loop, you can manage and monitor your loops using the Amazon Augmented AI Runtime API and Amazon EventBridge (also known as Amazon CloudWatch Events). To learn more, see [Monitor and Manage Your Human Loop \(p. 2376\)](#).

## End-to-end Tutorial Using Amazon A2I Custom Task Types

For an end-to-end examples that demonstrates how to integrate Amazon A2I into a variety of ML workflows, see the table in [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#). To get started using one of these notebooks, see [Use SageMaker Notebook Instance with Amazon A2I Jupyter Notebook \(p. 2332\)](#).

# Create a Human Review Workflow

Use an Amazon Augmented AI (Amazon A2I) *human review workflow*, or *flow definition*, to specify the following:

- For the Amazon Textract and Amazon Rekognition built-in task types, the conditions under which your human loop is called
- The workforce to which your tasks are sent
- The set of instructions that your workforce receives, which is called a *worker task template*
- The configuration of your worker tasks, including the number of workers that receive a task and time limits to complete tasks
- Where your output data is stored

You can create a human review workflow in the SageMaker console or using the SageMaker `CreateFlowDefinition` operation. You can build a worker task template using the console for Amazon Textract and Amazon Rekognition task types while creating your flow definition.

### Important

Human loop activation conditions, which initiate the human loop—for example, confidence thresholds—are not available for Amazon A2I custom task types. When using the console to create a flow definition for a custom task type, you can't specify activation conditions. When using the Amazon A2I API to create a flow definition for a custom task type, you can't set the `HumanLoopActivationConditions` attribute of the `HumanLoopActivationConditionsConfig` parameter. To control when human reviews are initiated, specify conditions under which `StartHumanLoop` is called in your custom application. In this case, every `StartHumanLoop` invocation results in a human review. For more information, see [Use Amazon Augmented AI with Custom Task Types \(p. 2337\)](#).

### Prerequisites

To create a human review workflow definition, you must have completed the prerequisites described in [Prerequisites to Using Augmented AI \(p. 2314\)](#).

If you use the API to create a flow definition for any task type, or if you use a custom task type when creating a flow definition in the console, first create a worker task template. For more information, see [Create and Manage Worker Task Templates \(p. 2366\)](#).

If you want to preview your worker task template while creating a flow definition for a built-in task type in the console, ensure that you grant the role that you use to create the flow definition permission to

access the Amazon S3 bucket that contains your template artifacts using a policy like the one described in [Enable Worker Task Template Previews \(p. 2390\)](#).

#### Topics

- [Create a Human Review Workflow \(Console\) \(p. 2340\)](#)
- [Create a Human Review Workflow \(API\) \(p. 2341\)](#)
- [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI \(p. 2345\)](#)

## Create a Human Review Workflow (Console)

Use this procedure to create a Amazon Augmented AI (Amazon A2I) human review workflow using the SageMaker console. If you are new to Amazon A2I, we recommend that you create a private work team using people in your organization, and use this work team's ARN when creating your flow definition. To learn how to set up a private workforce and create a work team, see [Create a Private Workforce \(Amazon SageMaker Console\) \(p. 462\)](#). If you have already set up a private workforce, see [Create a Work Team Using the SageMaker Console \(p. 466\)](#) to learn how to add a work team to that workforce.

If you are using Amazon A2I with one of the built-in task types, you can create worker instructions using a default worker task template provided by Augmented AI while creating a human review workflow in the console. To see samples of the default templates provided by Augmented AI, see the built-in task types in [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#).

#### To create flow definition (console)

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows** and then choose **Create human review workflow**.
3. In **Overview**, do the following:
  - a. For **Name**, enter a unique workflow name. The name must be lowercase, unique within the Amazon Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
  - b. For **S3 location for output**, enter the S3 bucket where you want to store the human review results. The bucket must be located in the same Amazon Region as the workflow.
  - c. For **IAM role**, choose the role that has the required permissions. If you choose a built-in task type and want to preview your worker template in the console, provide a role with the type of policy described in [Enable Worker Task Template Previews \(p. 2390\)](#) attached.
4. For **Task type**, choose the task type that you want the human worker to perform.
5. If you chose the Amazon Rekognition or Amazon Textract task type, specify the conditions that invoke human review.
  - For Amazon Rekognition image moderation tasks, choose an inference confidence score threshold interval that initiates human review.
  - For Amazon Textract tasks, you can initiate a human review when specific form keys are missing or when form key detection confidence is low. You can also initiate a human review if, after evaluating all of the form keys in the text, confidence is lower than your required threshold for any form key. Two variables specify your confidence thresholds: **Identification confidence** and **Qualification confidence**. To learn more about these variables, see [Use Amazon Augmented AI with Amazon Textract \(p. 2332\)](#).
  - For both task types, you can randomly send a percentage of data objects (images or forms) and their labels to humans for review.
6. Configure and specify your worker task template:

- a. If you are using the Amazon Rekognition or Amazon Textract task type:
    - In the **Create template** section:
      - To create instructions for your workers using the Amazon A2I default template for Amazon Rekognition and Amazon Textract task types, choose **Build from a default template**.
      - If you choose **Build from a default template**, create your instructions under **Worker task design**:
        - Provide a **Template name** that is unique in the Amazon Region you are in.
        - In the **Instructions** section, provide detailed instructions on how to complete your task. To help workers achieve greater accuracy, provide good and bad examples.
        - (Optional) In **Additional instructions**, provide your workers with additional information and instructions.
    - For information on creating effective instructions, see [Creating Good Worker Instructions \(p. 2375\)](#).
      - To select a custom template that you've created, choose it from the **Template** menu and provide a **Task description** to briefly describe the task for your workers. To learn how to create a custom template, see [Create a Worker Task Template \(p. 2367\)](#).
  - b. If you are using the custom task type:
    - In the **Worker task template** section, select your template from the list. All of the templates that you have created in the SageMaker console appear in this list. To learn how to create a template for custom task types, see [Create and Manage Worker Task Templates \(p. 2366\)](#).
7. (Optional) Preview your worker template:
- For Amazon Rekognition and Amazon Textract task types, you have the option to choose **See a sample worker task** to preview your worker task UI.
- If you are creating a flow definition for a custom task type, you can preview your worker task UI using the `RenderUiTemplate` operation. For more information, see [Preview a Worker Task Template \(p. 2375\)](#).
8. For **Workers**, choose a workforce type.
  9. Choose **Create**.

## Next Steps

After you've created a human review workflow, it appears in the console under **Human review workflows**. To see your flow definition's Amazon Resource Name (ARN) and configuration details, choose the workflow by selecting its name.

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that Amazon service's API (for example, the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both options, see [Create and Start a Human Loop \(p. 2358\)](#).

## Create a Human Review Workflow (API)

To create a flow definition using the SageMaker API, you use the `CreateFlowDefinition` operation. After you complete the [Prerequisites to Using Augmented AI \(p. 2314\)](#), use the following procedure to learn how to use this API operation.

For an overview of the `CreateFlowDefinition` operation, and details about each parameter, see [CreateFlowDefinition](#).

### To create a flow definition (API)

1. For `FlowDefinitionName`, enter a unique name. The name must be unique within the Amazon Region in your account, and can have up to 63 characters. Valid characters include: a-z, 0-9, and - (hyphen).
2. For `RoleArn`, enter the ARN of the role that you configured to grant access to your data sources.
3. For `HumanLoopConfig`, enter information about the workers and what they should see. For information about each parameter in `HumanLoopConfig`, see [HumanLoopConfig](#).
4. (Optional) If you are using a built-in task type, provide conditions that initiate a human loop in `HumanLoopActivationConfig`. To learn how to create the input required for the `HumanLoopActivationConfig` parameter, see [JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI \(p. 2345\)](#). If you do not specify conditions here, when you provide a flow definition to the Amazon service associated with a built-in task type (for example, Amazon Textract or Amazon Rekognition), that service sends every task to a human worker for review.

If you are using a custom task type, `HumanLoopActivationConfig` is disabled. To learn how to control when tasks are sent to human workers using a custom task type, see [Use Amazon Augmented AI with Custom Task Types \(p. 2337\)](#).

5. (Optional) If you are using a built-in task type, specify the integration source (for example, Amazon Rekognition or Amazon Textract) in the `HumanLoopRequestSource` parameter.
6. For `OutputConfig`, indicate where in Amazon Simple Storage Service (Amazon S3) to store the output of the human loop.
7. (Optional) Use `Tags` to enter key-value pairs to help you categorize and organize a flow definition. Each tag consists of a key and a value, both of which you define.

#### Amazon Textract – Key-value pair extraction

The following is an example of a request to create an Amazon Textract human review workflow (flow definition) using the Amazon SDK for Python (Boto3). You must use '`AWS/Textract/AnalyzeDocument/Forms/V1`' to create a Amazon Textract human loop. Only include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```
sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Textract/AnalyzeDocument/Forms/V1'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-task-ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1', 'Keyword2'
        ]
    }
)
```

```

        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig={
        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags:[
        {
            'Key': 'KeyName',
            'Value': 'ValueName'
        },
    ]
)

```

#### Amazon Rekognition – Image moderation

The following is an example of a request to create an Amazon Rekognition human review workflow (flow definition) using the Amazon SDK for Python (Boto3). You must use 'AWS/Rekognition/DetectModerationLabels/Image/V3' to create an Amazon Rekognition flow definition. Only include PublicWorkforceTaskPrice if you are using the Mechanical Turk workforce.

```

sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(
    FlowDefinitionName='ExampleFlowDefinition',
    HumanLoopRequestSource={
        'AwsManagedHumanLoopRequestSource': 'AWS/Rekognition/DetectModerationLabels/
Image/V3'
    },
    HumanLoopActivationConfig={
        'HumanLoopActivationConditionsConfig': {
            'HumanLoopActivationConditions': '{...}'
        }
    },
    HumanLoopConfig={
        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/
private-crowd/workteam_name',
        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-task-
ui/template_name',
        'TaskTitle': 'Example task title',
        'TaskDescription': 'Example task description.',
        'TaskCount': 123,
        'TaskAvailabilityLifetimeInSeconds': 123,
        'TaskTimeLimitInSeconds': 123,
        'TaskKeywords': [
            'Keyword1', 'Keyword2'
        ],
        'PublicWorkforceTaskPrice': {
            'AmountInUsd': {
                'Dollars': 123,
                'Cents': 123,
                'TenthFractionsOfACent': 123
            }
        }
    },
    OutputConfig=

```

```

        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::aws_account_number:role/role_name',
    Tags=[  

        {  

            'Key': 'KeyName',  

            'Value': 'ValueName'  

        },  

    ]  

)

```

## Custom Workflow

The following is an example of a request to create a human review workflow (flow definition) for a custom integration. To create this type of human review workflow, omit `HumanLoopRequestSource` from the flow definition request. You only need to include `PublicWorkforceTaskPrice` if you are using the Mechanical Turk workforce.

```

sagemaker_client = boto3.client('sagemaker', aws_region)

response = sagemaker_client.create_flow_definition(  

    FlowDefinitionName='ExampleFlowDefinition',  

    HumanLoopActivationConfig={  

        'HumanLoopActivationConditionsConfig': {  

            'HumanLoopActivationConditions': '{...}'  

        }  

    },  

    HumanLoopConfig={  

        'WorkteamArn': 'arn:aws:sagemaker:aws_region:aws_account_number:workteam/  

private-crowd/workteam_name',  

        'HumanTaskUiArn': 'arn:aws:sagemaker:aws_region:aws_account_number:human-task-  

ui/template_name',  

        'TaskTitle': 'Example task title',  

        'TaskDescription': 'Example task description.',  

        'TaskCount': 123,  

        'TaskAvailabilityLifetimeInSeconds': 123,  

        'TaskTimeLimitInSeconds': 123,  

        'TaskKeywords': [  

            'Keyword1', 'Keyword2'  

        ],  

        'PublicWorkforceTaskPrice': {  

            'AmountInUsd': {  

                'Dollars': 123,  

                'Cents': 123,  

                'TenthFractionsOfACent': 123  

            }  

        }  

    },  

    OutputConfig={  

        'S3OutputPath': 's3://bucket/path/',
        'KmsKeyId': '1234abcd-12ab-34cd-56ef-1234567890ab'
    },
    RoleArn='arn:aws:iam::account_number:role/role_name',
    Tags=[  

        {  

            'Key': 'KeyName',  

            'Value': 'ValueName'  

        },
    ]
)

```

## Next Steps

The return value of a successful call of the `CreateFlowDefinition` API operation is a flow definition Amazon Resource Name (ARN).

If you are using a built-in task type, you can use the flow definition ARN to start a human loop using that Amazon service's API (i.e. the Amazon Textract API). For custom task types, you can use the ARN to start a human loop using the Amazon Augmented AI Runtime API. To learn more about both of these options, see [Create and Start a Human Loop \(p. 2358\)](#).

## JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI

The `HumanLoopActivationConditions` is an input parameter of the `CreateFlowDefinition` API. This parameter is a JSON-formatted string. The JSON models the conditions under which a human loop is created when those conditions are evaluated against the response from an integrating AI service API (such as `Rekognition.DetectModerationLabels` or `Textract.AnalyzeDocument`). This response is referred to as an *inference*. For example, Amazon Rekognition sends an inference of a moderation label with an associated confidence score. In this example, the inference is the model's best estimate of the appropriate label for an image. For Amazon Textract, inference is made on the association between blocks of text (*key-value pairs*), such as the association between `Name` : and `Sue` in a form as well as content within a block of text, or *word block*, such as '`Name`'.

The following is the schema for the JSON. At the top level, the `HumanLoopActivationConditions` has a JSON array, `Conditions`. Each member of this array is an independent condition that, if evaluated to true, results in Amazon A2I creating a human loop. Each such independent condition can be a simple condition or a complex condition. A simple condition has the following attributes:

- `ConditionType`: This attribute identifies the type of condition. Each Amazon AI service API that integrates with Amazon A2I defines its own set of allowed `ConditionTypes`.
  - `Rekognition DetectModerationLabels` – This API supports the `ModerationLabelConfidenceCheck` and `Sampling ConditionType` values.
  - `Textract AnalyzeDocument` – This API supports the `ImportantFormKeyConfidenceCheck`, `MissingImportantFormKey`, and `Sampling ConditionType` values.
- `ConditionParameters` – This is a JSON object that parameterizes the condition. The set of allowed attributes of this object is dependent on the value of the `ConditionType`. Each `ConditionType` defines its own set of `ConditionParameters`.

A member of the `Conditions` array can model a complex condition. This is accomplished by logically connecting simple conditions using the `And` and `Or` logical operators and nesting the underlying simple conditions. Up to two levels of nesting are supported.

```
{  
    "$schema": "http://json-schema.org/draft-07/schema#",  
    "definitions": {  
        "Condition": {  
            "type": "object",  
            "properties": {  
                "ConditionType": {  
                    "type": "string"  
                },  
                "ConditionParameters": {  
                    "type": "object"  
                }  
            }  
        }  
    }  
}
```

                "$ref": "#/definitions/OrConditionArray"
            },
            {
                "$ref": "#/definitions/AndConditionArray"
            }
        ]
    }
},
"type": "object",
"properties": {
    "Conditions": {
        "type": "array",
        "items": {
            "$ref": "#/definitions/ComplexCondition"
        }
    }
}
}
```

### Note

Human loop activation conditions aren't available for human review workflows that are integrated with custom task types. The `HumanLoopActivationConditions` parameter is disabled for custom task types.

### Topics

- [Use Human Loop Activation Conditions JSON Schema with Amazon Textract \(p. 2347\)](#)
- [Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition \(p. 2353\)](#)

## Use Human Loop Activation Conditions JSON Schema with Amazon Textract

When used with Amazon A2I, the `AnalyzeDocument` operation supports the following inputs in the `ConditionType` parameter:

- `ImportantFormKeyConfidenceCheck` – Use this condition to create a human loop when inference confidence is within a specified range for document form keys and word blocks. A *form key* is any word in a document that is associated with an input. The input is called a *value*. Together, form keys and values are referred to as *key-value pairs*. A *word block* refers to the words that Amazon Textract recognizes inside of a detected block of text. To learn more about Amazon Textract document blocks, see [Documents and Block Objects](#) in the *Amazon Textract Developer Guide*.
- `MissingImportantFormKey` – Use this condition to create a human loop when Amazon Textract did not identify the key or its associated aliases within the document.
- `Sampling` – Use this condition to specify a percentage of forms to send to humans for review, regardless of inference confidence scores. Use this condition to do the following:
  - Audit your ML model by randomly sampling all forms analyzed by your model and sending a specified percentage to humans for review.
  - Using the `ImportantFormKeyConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ImportantFormKeyConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

### Note

If you send the same request to `AnalyzeDocument` multiple times, the result of `Sampling` does not change for the inference of that input. For example, if you make an `AnalyzeDocument` request once, and `Sampling` doesn't initiate a human loop, subsequent requests to `AnalyzeDocument` with the same configuration do not initiate a human loop.

## ImportantFormKeyConfidenceCheck Inputs and Results

The `ImportantFormKeyConfidenceCheck` `ConditionType` supports the following `ConditionParameters`:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers. If the value of this parameter is the special catch-all value (\*), then all keys are considered to be matched to the condition. You can use this to model the case where any key-value pair satisfying certain confidence thresholds needs human review.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.
- `KeyValueBlockConfidenceEquals`
- `KeyValueBlockConfidenceLessThan`
- `KeyValueBlockConfidenceLessThanEquals`
- `KeyValueBlockConfidenceGreaterThan`
- `KeyValueBlockConfidenceGreaterThanOrEqual`
- `WordBlockConfidenceEquals`
- `WordBlockConfidenceLessThan`
- `WordBlockConfidenceLessThanEquals`
- `WordBlockConfidenceGreaterThan`
- `WordBlockConfidenceGreaterThanOrEqual`

When you use the `ImportantFormKeyConfidenceCheck` ConditionType, Amazon A2I sends the key-value block and word block inferences of the key-value blocks and associated aliases that you specified in `ImportantFormKey` and `ImportantFormKeyAliases` for human review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker console, key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{ { task.input.selectedAiServiceResponse.blocks } }` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see [Custom Template Example for Amazon Textract \(p. 2369\)](#).

## MissingImportantFormKey Inputs and Results

The `MissingImportantFormKey` ConditionType supports the following ConditionParameters:

- `ImportantFormKey` – A string representing a key in a key-value pair detected by Amazon Textract that needs to be reviewed by human workers.
- `ImportantFormKeyAliases` – An array that represents alternate spellings or logical equivalents for the important form key.

When you use the `MissingImportantFormKey` ConditionType, if the key in `ImportantFormKey` or aliases in `ImportantFormKeyAliases` are not included in the Amazon Textract inference, that form is sent to human for review and no predicted key-value pairs are included. For example, if Amazon Textract only identified `Address` and `Phone` in a form, but was missing the `ImportantFormKey Name` (in the `MissingImportantFormKey` condition type) that form would be sent to humans for review without any of the form keys detected (`Address` and `Phone`).

If you use the default worker task template that is provided in the SageMaker console, a task is created asking workers to identify the key in `ImportantFormKey` and associated value. If you use a custom worker task template, you need to include the `<task.input.humanLoopContext>` custom HTML element to configure this task.

## Sampling Inputs and Results

The `Sampling` ConditionType supports the `RandomSamplingPercentage` ConditionParameters. The input for `RandomSamplingPercentage` must be real number between 0.01 and 100. This number represents the percentage of data that qualifies for a human review and is sent to humans for review. If you use the `Sampling` condition without any other conditions, this number represents the percentage of all resulting inferences made by the `AnalyzeDocument` operation from a single request that is sent to humans for review.

If you specify the `Sampling` condition without any other condition type, all key-value and block inferences are sent to workers for review.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the SageMaker console, all key-value and block inferences sent for human review by this activation condition are included in the worker UI. If you use a custom worker task template, you need to include the `{ { task.input.selectedAiServiceResponse.blocks } }` element to include initial-value input data (inferences) from Amazon Textract. For an example of a custom template that uses this input element, see [Custom Template Example for Amazon Textract \(p. 2369\)](#).

## Examples

While only one condition needs to evaluate to `true` to initiate a human loop, Amazon A2I evaluates all conditions for each object analyzed by Amazon Textract. The human reviewers are asked to review the important form keys for all the conditions that evaluated to `true`.

**Example 1: Detect important form keys with confidence scores in a specified range that initiate a human loop**

The following example shows a `HumanLoopActivationConditions` JSON that initiates a human loop if any one of the following three conditions is met:

- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `EmployeeName`, `Name`, or `EmployeeName`, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block being less than 65 and the confidences of each of the word blocks making up the key and value being less than 85.
- The Amazon Textract `AnalyzeDocument` API returns a key-value pair whose key is one of `Gross Pay`, `GrossPay`, or `GrossAmount`, with the confidence of the key-value block being less than 60 and the confidences of each of the word blocks making up the key and value being less than 85.

```
{
    "Conditions": [
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Employee Name",
                "ImportantFormKeyAliases": [
                    "Name",
                    "EmployeeName"
                ],
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 85
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Pay Date",
                "ImportantFormKeyAliases": [
                    "PayDate",
                    "DateOfPay",
                    "pay-date"
                ],
                "KeyValueBlockConfidenceLessThan": 65,
                "WordBlockConfidenceLessThan": 85
            }
        },
        {
            "ConditionType": "ImportantFormKeyConfidenceCheck",
            "ConditionParameters": {
                "ImportantFormKey": "Gross Pay",
                "ImportantFormKeyAliases": [
                    "GrossPay",
                    "GrossAmount"
                ],
                "KeyValueBlockConfidenceLessThan": 60,
                "WordBlockConfidenceLessThan": 85
            }
        }
    ]
}
```

**Example 2: Use `ImportantFormKeyConfidenceCheck`**

In the following example, if Amazon Textract detects a key-value pair whose confidence for the key-value block is less than 60 and is less than 90 for any underlying word blocks, it creates a human loop. The human reviewers are asked to review all the form key-value pairs that matched the confidence value comparisons.

```
{  
    "Conditions": [  
        {  
            "ConditionType": "ImportantFormKeyConfidenceCheck",  
            "ConditionParameters": {  
                "ImportantFormKey": "*"  
                "KeyValueBlockConfidenceLessThan": 60,  
                "WordBlockConfidenceLessThan": 90  
            }  
        }  
    ]  
}
```

### Example 3: Use Sampling

In the following example, 5% of inferences resulting from an Amazon Textract AnalyzeDocument request are sent to human workers for review. All detected key-value pairs returned by Amazon Textract are sent to workers for review.

```
{  
    "Conditions": [  
        {  
            "ConditionType": "Sampling",  
            "ConditionParameters": {  
                "RandomSamplingPercentage": 5  
            }  
        }  
    ]  
}
```

### Example 4: Use MissingImportantFormKey

In the following example, if `Mailing Address` or its alias, `Mailing Address:`, is missing from keys detected by Amazon Textract, a human review is initiated. When using the default worker task template, the worker UI asks workers to identify the key `Mailing Address` or `Mailing Address:` and its associated value.

```
{  
    "ConditionType": "MissingImportantFormKey",  
    "ConditionParameters": {  
        "ImportantFormKey": "Mailing Address",  
        "ImportantFormKeyAliases": ["Mailing Address:"]  
    }  
}
```

### Example 5: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator

In this example, 5% of key-value pairs detected by Amazon Textract whose key is one of `Pay Date`, `PayDate`, `DateOfPay`, or `pay-date`, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85, are sent to workers for review.

```
{
```

```

"Conditions": [
  {
    "And": [
      {
        "ConditionType": "Sampling",
        "ConditionParameters": {
          "RandomSamplingPercentage": 5
        }
      },
      {
        "ConditionType": "ImportantFormKeyConfidenceCheck",
        "ConditionParameters": {
          "ImportantFormKey": "Pay Date",
          "ImportantFormKeyAliases": [
            "PayDate",
            "DateOfPay",
            "pay-date"
          ],
          "KeyValueBlockConfidenceLessThan": 65,
          "WordBlockConfidenceLessThan": 85
        }
      }
    ]
  }
]
}

```

#### **Example 6: Use Sampling and ImportantFormKeyConfidenceCheck with the And operator**

Use this example to configure your human review workflow to always send low confidence inferences of a specified key-value pair for human review and sample high confidence inference of a key-value pair at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences less than 60, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.
- 5% of key-value pairs detected whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with key-value and word block confidences greater than 90, are sent for human review. Only the Pay Date form key (and its aliases) and associated values are sent to workers to review.

```

{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
              "PayDate",
              "DateOfPay",
              "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 60,
            "WordBlockConfidenceLessThan": 60
          }
        },
        {
          "And": [
            {

```

```
        "ConditionType": "Sampling",
        "ConditionParameters": {
            "RandomSamplingPercentage": 5
        }
    },
{
    "ConditionType": "ImportantFormKeyConfidenceCheck",
    "ConditionParameters": {
        "ImportantFormKey": "Pay Date",
        "ImportantFormKeyAliases": [
            "PayDate",
            "DateOfPay",
            "pay-date"
        ],
        "KeyValueBlockConfidenceLessThan": 90
        "WordBlockConfidenceGreaterThan": 90
    }
}
]
}
]
```

**Example 7: Use Sampling and ImportantFormKeyConfidenceCheck with the Or operator**

In the following example, the Amazon Textract AnalyzeDocument operation returns a key-value pair whose key is one of Pay Date, PayDate, DateOfPay, or pay-date, with the confidence of the key-value block less than 65 and the confidences of each of the word blocks making up the key and value less than 85. Additionally, 5% of all other forms initiate a human loop. For each form randomly chosen, all key-value pairs detected for that form are sent to humans for review.

```
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ImportantFormKeyConfidenceCheck",
          "ConditionParameters": {
            "ImportantFormKey": "Pay Date",
            "ImportantFormKeyAliases": [
              "PayDate",
              "DateOfPay",
              "pay-date"
            ],
            "KeyValueBlockConfidenceLessThan": 65,
            "WordBlockConfidenceLessThan": 85
          }
        }
      ]
    }
  ]
}
```

## Use Human Loop Activation Conditions JSON Schema with Amazon Rekognition

When used with Amazon A2I, the Amazon Rekognition `DetectModerationLabels` operation supports the following inputs in the `ConditionType` parameters:

- `ModerationLabelConfidenceCheck` – Use this condition type to create a human loop when inference confidence is low for one or more specified labels.
- `Sampling` – Use this condition to specify a percentage of all inferences to send to humans for review. Use this condition to do the following:
  - Audit your ML model by randomly sampling all of your model's inferences and sending a specified percentage to humans for review.
  - Using the `ModerationLabelConfidenceCheck` condition, randomly sample a percentage of the inferences that met the conditions specified in `ModerationLabelConfidenceCheck` to start a human loop and send only the specified percentage to humans for review.

### Note

If you send the same request to `DetectModerationLabels` multiple times, the result of `Sampling` does not change for the inference of that input. For example, if you make a `DetectModerationLabels` request once, and `Sampling` does not initiate a human loop, subsequent requests to `DetectModerationLabels` with the same configuration don't initiate a human loop.

When creating a flow definition, if you use the default worker task template that is provided in the **Human review workflows** section of the Amazon SageMaker console, inferences sent for human review by these activation conditions are included in the worker UI when a worker opens your task. If you use a custom worker task template, you need to include the `<task.input.selectedAiServiceResponse.blocks>` custom HTML element to access these inferences. For an example of a custom template that uses this HTML element, see [Custom Template Example for Amazon Rekognition \(p. 2371\)](#).

### ModerationLabelConfidenceCheck Inputs

For the `ModerationLabelConfidenceCheck` `ConditionType`, the following `ConditionParameters` are supported:

- `ModerationLabelName` – The exact (case-sensitive) name of a `ModerationLabel` detected by the Amazon Rekognition `DetectModerationLabels` operation. You can specify the special catch-all value (\*) to denote any moderation label.
- `ConfidenceEquals`
- `ConfidenceLessThan`
- `ConfidenceLessThanEquals`
- `ConfidenceGreater Than`
- `ConfidenceGreater ThanEquals`

When you use the `ModerationLabelConfidenceCheck` `ConditionType`, Amazon A2I sends label inferences for the labels that you specified in `ModerationLabelName` for human review.

### Sampling Inputs

The `Sampling` `ConditionType` supports the `RandomSamplingPercentage` `ConditionParameters`. The input for the `RandomSamplingPercentage` parameter should be real number between 0.01 and

100. This number represents the percentage of inferences that qualifies for a human review that are sent to humans for review. If you use the `Sampling` condition without any other conditions, this number represents the percentage of all inferences that result from a single `DetectModerationLabel` request that are sent to humans for review.

## Examples

### Example 1: Use `ModerationLabelConfidenceCheck` with the `And` operator

The following example of a `HumanLoopActivationConditions` condition initiates a human loop when one or more of the following conditions are met:

- Amazon Rekognition detects the `Graphic Male Nudity` moderation label with a confidence between 90 and 99.
- Amazon Rekognition detects the `Graphic Female Nudity` moderation label with a confidence between 80 and 99.

Note the use of the `Or` and `And` logical operators to model this logic.

Although only one of the two conditions under the `Or` operator needs to evaluate to `true` for a human loop to be created, Amazon Augmented AI evaluates all conditions. Human reviewers are asked to review the moderation labels for all the conditions that evaluated to `true`.

```
{
    "Conditions": [
        {
            "Or": [
                {
                    "And": [
                        {
                            "ConditionType": "ModerationLabelConfidenceCheck",
                            "ConditionParameters": {
                                "ModerationLabelName": "Graphic Male Nudity",
                                "ConfidenceLessThanEquals": 99
                            }
                        },
                        {
                            "ConditionType": "ModerationLabelConfidenceCheck",
                            "ConditionParameters": {
                                "ModerationLabelName": "Graphic Male Nudity",
                                "ConfidenceGreaterThanOrEqual": 90
                            }
                        }
                    ]
                },
                {
                    "And": [
                        {
                            "ConditionType": "ModerationLabelConfidenceCheck",
                            "ConditionParameters": {
                                "ModerationLabelName": "Graphic Female Nudity",
                                "ConfidenceLessThanEquals": 99
                            }
                        },
                        {
                            "ConditionType": "ModerationLabelConfidenceCheck",
                            "ConditionParameters": {
                                "ModerationLabelName": "Graphic Female Nudity",
                                "ConfidenceGreaterThanOrEqual": 80
                            }
                        }
                    ]
                }
            ]
        }
    ]
}
```

```
}
```

### Example 2: Use `ModerationLabelConfidenceCheck` with the catch-all value (\*)

In the following example, if any moderation label with a confidence greater than or equal to 75 is detected, a human loop is initiated. Human reviewers are asked to review all moderation labels with confidence scores greater than or equal to 75.

```
{
  "Conditions": [
    {
      "ConditionType": "ModerationLabelConfidenceCheck",
      "ConditionParameters": {
        "ModerationLabelName": "*",
        "ConfidenceGreaterThanOrEqual": 75
      }
    }
  ]
}
```

### Example 3: Use Sampling

In the following example, 5% of Amazon Rekognition inferences from a `DetectModerationLabels` request are sent to human workers. When using the default worker task template provided in the SageMaker console, all moderation labels returned by Amazon Rekognition are sent to workers for review.

```
{
  "Conditions": [
    {
      "ConditionType": "Sampling",
      "ConditionParameters": {
        "RandomSamplingPercentage": 5
      }
    }
  ]
}
```

### Example 4: Use Sampling and `ModerationLabelConfidenceCheck` with the `And` operator

In this example, 5% of Amazon Rekognition inferences of the `Graphic Male Nudity` moderation label with a confidence greater than 50 are sent workers for review. When using the default worker task template provided in the SageMaker console, only the inferences of the `Graphic Male Nudity` label are sent to workers for review.

```
{
  "Conditions": [
    {
      "And": [
        {
          "ConditionType": "Sampling",
          "ConditionParameters": {
            "RandomSamplingPercentage": 5
          }
        },
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceGreaterThanOrEqual": 50
          }
        }
      ]
    }
  ]
}
```

```
        ]
    }
}
```

#### Example 5: Use Sampling and ModerationLabelConfidenceCheck with the And operator

Use this example to configure your human review workflow to always send low-confidence inferences of a specified label for human review and sample high-confidence inferences of a label at a specified rate.

In the following example, a human review is initiated in one of the following ways:

- Inferences for the `Graphic Male Nudity` moderation label with confidence scores less than 60 are always sent for human review. Only the `Graphic Male Nudity` label is sent to workers to review.
- 5% of all inferences for the `Graphic Male Nudity` moderation label with confidence scores greater than 90 are sent for human review. Only the `Graphic Male Nudity` label is sent to workers to review.

```
{
  "Conditions": [
    {
      "Or": [
        {
          "ConditionType": "ModerationLabelConfidenceCheck",
          "ConditionParameters": {
            "ModerationLabelName": "Graphic Male Nudity",
            "ConfidenceLessThan": 60
          }
        },
        {
          "And": [
            {
              "ConditionType": "Sampling",
              "ConditionParameters": {
                "RandomSamplingPercentage": 5
              }
            },
            {
              "ConditionType": "ModerationLabelConfidenceCheck",
              "ConditionParameters": {
                "ModerationLabelName": "Graphic Male Nudity",
                "ConfidenceGreaterThan": 90
              }
            }
          ]
        }
      ]
    }
}
```

#### Example 6: Use Sampling and ModerationLabelConfidenceCheck with the Or operator

In the following example, a human loop is created if the Amazon Rekognition inference response contains the 'Graphic Male Nudity' label with inference confidence greater than 50. Additionally, 5% of all other inferences initiate a human loop.

```
{
  "Conditions": [
```

```
{  
    "Or": [  
        {  
            "ConditionType": "Sampling",  
            "ConditionParameters": {  
                "RandomSamplingPercentage": 5  
            }  
        },  
        {  
            "ConditionType": "ModerationLabelConfidenceCheck",  
            "ConditionParameters": {  
                "ModerationLabelName": "Graphic Male Nudity",  
                "ConfidenceGreaterThan": 50  
            }  
        }  
    ]  
}
```

## Delete a Human Review Workflow

When you delete a human review workflow or you delete your Amazon account while a human loop is in process, your human review workflow status changes to `Deleting`. Amazon A2I automatically stops and deletes all associated human loops if workers have not started tasks created by those human loops. If human workers are already working on a task, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human review workflow's status is `Deleting`. If these tasks are completed, the results are stored in the Amazon S3 bucket specified in your flow definition.

Deleting a flow definition does not remove any worker answers from your S3 bucket. If the tasks are completed, but you deleted your Amazon account, the results are stored in the Augmented AI service bucket for 30 days and then permanently deleted.

After all human loops have been deleted, the human review workflow is permanently deleted. When a human review workflow has been deleted, you can reuse its name to create a new human review workflow.

You might want to delete a human review workflow for any of the following reasons:

- You have sent data to a set of human reviewers and you want to delete all non-started human loops because you do not want those workers to work on those tasks any longer.
- The worker task template used to generate your worker UI does not render correctly or is not functioning as expected.

After you delete a human review workflow, the following changes occur:

- The human review workflow no longer appears on the **Human review workflows** page in the Augmented AI area of the Amazon SageMaker console.
- When you use the human review workflow name as input to the API operations `DescribeFlowDefinition` or `DeleteFlowDefinition`, Augmented AI returns a `ResourceNotFoundException`.
- When you use `ListFlowDefinitions`, deleted human review workflows aren't included in the results.
- When you use the human review workflow ARN as input to the Augmented AI Runtime API operation `ListHumanLoops`, Augmented AI returns a `ResourceNotFoundException`.

# Delete a Flow Definition Using the Console or the SageMaker API

You can delete a human review workflow on the **Human review workflows** page in the Augmented AI area of the SageMaker console or by using the SageMaker API.

Flow definitions can only be deleted if their status is **Active**.

## Delete a human review workflow (console)

1. Navigate to the Augmented AI console at <https://console.amazonaws.cn/a2i/>.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.
3. Select the hyperlinked name of the human review workflow that you want to delete.
4. On the **Summary** page of your human review workflow, choose **Delete**.
5. In the dialog box asking you to confirm that you want to delete your human review workflow, choose **Delete**.

You're automatically redirected to the **Human review workflows** page. While your human review workflow is being deleted, the status **Deleting** appears in the status column for that workflow. After it's deleted, it doesn't appear in the list of workflows on this page.

## Delete a human review workflow (API)

You can delete a human review workflow (flow definition) using the SageMaker [DeleteFlowDefinition](#) API operation. This API operation is supported through the [Amazon CLI](#) and a [variety of language specific SDKs](#). The following table shows example requests using SDK for Python (Boto3) and the Amazon CLI to delete the human review workflow, *example-flow-definition*.

### Amazon SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3) to delete the human review workflow. For more information, see [delete\\_flow\\_definition](#) in the [Amazon SDK for Python \(Boto\) API Reference](#).

```
import boto3

sagemaker_client = boto3.client('sagemaker')
response = sagemaker_client.delete_flow_definition(FlowDefinitionName='example-flow-
definition')
```

### Amazon CLI

The following request example uses the Amazon CLI to delete the human review workflow. For more information, see [delete-flow-definition](#) in the [Amazon CLI Command Reference](#).

```
$ aws sagemaker delete-flow-definition --flow-definition-name 'example-flow-definition'
```

If the action is successful, Augmented AI sends back an HTTP 200 response with an empty HTTP body.

## Create and Start a Human Loop

A *human loop* starts your human review workflow and sends data review tasks to human workers. When you use one of the Amazon A2I built-in task types, the corresponding Amazon service creates and

starts a human loop on your behalf when the conditions specified in your flow definition are met. If no conditions are specified in your flow definition, a human loop is created for each object. When using Amazon A2I for a custom task, a human loop starts when your application calls `StartHumanLoop`.

Use the following instructions to configure a human loop with Amazon Rekognition or Amazon Textract built-in task types and custom task types.

### Prerequisites

To create and start a human loop, you must attach the `AmazonAugmentedAIFullAccess` policy to the Amazon Identity and Access Management (IAM) user or role that configures or starts the human loop. This is the identity that you use to configure the human loop using `HumanLoopConfig` for built-in task types. For custom task types, this is the identity that you use to call `StartHumanLoop`.

Additionally, when using a built-in task type, your IAM user or role must have permission to invoke API operations of the Amazon service associated with your task type. For example, if you are using Amazon Rekognition with Augmented AI, you must attach permissions required to call `DetectModerationLabels`. For examples of identity-based policies you can use to grant these permissions, see [Amazon Rekognition Identity-Based Policy Examples](#) and [Amazon Textract Identity-Based Policy Examples](#). You can also use the more general policy `AmazonAugmentedAIIIntegratedAPIAccess` to grant these permissions. For more information, see [Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations \(p. 2390\)](#).

To create and start a human loop, you need a flow definition ARN. To learn how to create a flow definition (or human review workflow), see [Create a Human Review Workflow \(p. 2339\)](#).

#### Important

Amazon A2I requires all S3 buckets that contain human loop input image data to have a CORS policy attached. To learn more about this change, see [CORS Permission Requirement \(p. 2387\)](#).

## Create and Start a Human Loop for a Built-in Task Type

To start a human loop using a built-in task type, use the corresponding service's API to provide your input data and to configure the human loop. For Amazon Textract, you use the `AnalyzeDocument` API operation. For Amazon Rekognition, you use the `DetectModerationLabels` API operation. You can use the Amazon CLI or a language-specific SDK to create requests using these API operations.

#### Important

When you create a human loop using a built-in task type, you can use `DataAttributes` to specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA. Include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the '`FreeOfAdultContent`' classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

After you start your ML job using your built-in task type's Amazon service API, Amazon A2I monitors the inference results of that service. For example, when running a job with Amazon Rekognition, Amazon A2I checks the inference confidence score for each image and compares it to the confidence thresholds specified in your flow definition. If the conditions to start a human review task are satisfied, or if you didn't specify conditions in your flow definition, a human review task is sent to workers.

## Create an Amazon Textract Human Loop

Amazon A2I integrates with Amazon Textract so that you can configure and start a human loop using the Amazon Textract API. To send a document file to Amazon Textract for document analysis, you use the Amazon Textract [AnalyzeDocument API operation](#). To add a human loop to this document analysis job, you must configure the parameter `HumanLoopConfig`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same Amazon Region as the bucket identified in `Bucket` of the `Document` parameter.

The following table shows examples of how to use this operation with the Amazon CLI and Amazon SDK for Python (Boto3).

### Amazon SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see [analyze\\_document](#) in the *Amazon SDK for Python (Boto) API Reference*.

```
import boto3

textract = boto3.client('textract', aws_region)

response = textract.analyze_document(
    Document={'S3Object': {'Bucket': bucket_name, 'Name': document_name}},
    FeatureTypes=['TABLES', "FORMS"],
    HumanLoopConfig={
        'FlowDefinitionArn':
            'arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name',
        'HumanLoopName': 'human_loop_name',
        'DataAttributes': {'ContentClassifiers':
            ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']}
    }
)
```

### Amazon CLI

The following request example uses the Amazon CLI. For more information, see [analyze-document](#) in the *Amazon CLI Command Reference*.

```
$ aws textract analyze-document \
--document '{"S3Object":{"Bucket":bucket_name,"Name":document_name}}' \
--human-loop-config \
HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws-
region:aws_account_number:flow-
definition/
flow_def_name",DataAttributes='{ContentClassifiers=[ "FreeOfPersonallyIdentifiableInformation",
"FreeOfAdultContent"]}' \
--feature-types '[ "TABLES", "FORMS"]'
```

```
$ aws textract analyze-document \
--document '{"S3Object":{"Bucket":bucket_name,"Name":document_name}}' \
--human-loop-config \
{"HumanLoopName": "human_loop_name", "FlowDefinitionArn": "arn:aws:sagemaker:aws_region:aws_account_
definition/flow_def_name", "DataAttributes": {"ContentClassifiers":
["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}}' \
--feature-types '[ "TABLES", "FORMS"]'
```

After you run `AnalyzeDocument` with a human loop configured, Amazon A2I monitors the results from `AnalyzeDocument` and checks it against the flow definition's activation conditions. If the Amazon Textract inference confidence score for one or more key-value pairs meets the conditions for review, Amazon A2I starts a human review loop and includes the `HumanLoopActivationOutput` object in the `AnalyzeDocument` response.

## Create an Amazon Rekognition Human Loop

Amazon A2I integrates with Amazon Rekognition so that you can configure and start a human loop using the Amazon Rekognition API. To send images to Amazon Rekognition for content moderation, you use the Amazon Rekognition `DetectModerationLabels` API operation. To configure a human loop, set the `HumanLoopConfig` parameter when you configure `DetectModerationLabels`.

When you configure your human loop, the flow definition you specify in `FlowDefinitionArn` of `HumanLoopConfig` must be located in the same Amazon Region as the S3 bucket identified in `Bucket` of the `Image` parameter.

The following table shows examples of how to use this operation with the Amazon CLI and Amazon SDK for Python (Boto3).

### Amazon SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see [detect\\_moderation\\_labels](#) in the *Amazon SDK for Python (Boto) API Reference*.

```
import boto3

rekognition = boto3.client("rekognition", aws_region)

response = rekognition.detect_moderation_labels( \
    Image={'S3Object': {'Bucket': bucket_name, 'Name': image_name}}, \
    HumanLoopConfig={ \
        'HumanLoopName': 'human_loop_name', \
        'FlowDefinitionArn': \
            "arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name" \
        'DataAttributes': {'ContentClassifiers': \
            ['FreeOfPersonallyIdentifiableInformation', 'FreeOfAdultContent']} \
    })
```

### Amazon CLI

The following request example uses the Amazon CLI. For more information, see [detect-moderation-labels](#) in the *Amazon CLI Command Reference*.

```
$ aws rekognition detect-moderation-labels \
--image "S3Object={Bucket='bucket_name',Name='image_name'}" \
--human-loop-config \
HumanLoopName="human_loop_name",FlowDefinitionArn="arn:aws:sagemaker:aws_region:aws_account_number:flow_definition/flow_def_name",DataAttributes='{ContentClassifiers=["FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent"]}'
```

```
$ aws rekognition detect-moderation-labels \
--image "S3Object={Bucket='bucket_name',Name='image_name'}" \
--human-loop-config \
'{"HumanLoopName": "human_loop_name", "FlowDefinitionArn": \
"arn:aws:sagemaker:aws_region:aws_account_number:flow-definition/flow_def_name", \
"DataAttributes": {"ContentClassifiers": ["FreeOfPersonallyIdentifiableInformation", \
"FreeOfAdultContent"]}}'
```

After you run `DetectModerationLabels` with a human loop configured, Amazon A2I monitors the results from `DetectModerationLabels` and checks it against the flow definition's activation conditions. If the Amazon Rekognition inference confidence score for an image meets the conditions for review, Amazon A2I starts a human review loop and includes the response element `HumanLoopActivationOutput` in the `DetectModerationLabels` response.

## Create and Start a Human Loop for a Custom Task Type

To configure a human loop for a custom human review task, use the `StartHumanLoop` operation within your application. This section provides an example of a human loop request using the Amazon SDK for Python (Boto3) and the Amazon Command Line Interface (Amazon CLI). For documentation on other language-specific SDKs that support `StartHumanLoop`, use the **See Also** section of [StartHumanLoop](#) in the Amazon Augmented AI Runtime API documentation. Refer to [Use Cases and Examples Using Amazon A2I \(p. 2330\)](#) to see examples that demonstrate how to use Amazon A2I with a custom task type.

### Prerequisites

To complete this procedure, you need:

- Input data formatted as a string representation of a JSON-formatted file
- The Amazon Resource Name (ARN) of your flow definition
- A flow definition ARN

### To configure the human loop

1. For `DataAttributes`, specify a set of `ContentClassifiers` related to the input provided to the `StartHumanLoop` operation. Use content classifiers to declare that your content is free of personally identifiable information or adult content.

To use Amazon Mechanical Turk, ensure your data is free of personally identifiable information, including protected health information under HIPAA, and include the `FreeOfPersonallyIdentifiableInformation` content classifier. If you do not use this content classifier, SageMaker does not send your task to Mechanical Turk. If your data is free of adult content, also include the '`FreeOfAdultContent`' classifier. If you do not use these content classifiers, SageMaker may restrict the Mechanical Turk workers that can view your task.

2. For `FlowDefinitionArn`, enter the Amazon Resource Name (ARN) of your flow definition.
3. For `HumanLoopInput`, enter your input data as a string representation of a JSON-formatted file. Structure your input data and custom worker task template so that your input data is properly displayed to human workers when you start your human loop. See [Preview a Worker Task Template \(p. 2375\)](#) to learn how to preview your custom worker task template.
4. For `HumanLoopName`, enter a name for the human loop. The name must be unique within the Region in your account and can have up to 63 characters. Valid characters are a-z, 0-9, and - (hyphen).

### To start a human loop

- To start a human loop, submit a request similar to the following examples using your preferred language-specific SDK.

#### Amazon SDK for Python (Boto3)

The following request example uses the SDK for Python (Boto3). For more information, see [Boto 3 Augmented AI Runtime](#) in the *Amazon SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')

response = a2i_runtime_client.start_human_loop(
    HumanLoopName='human_loop_name',
    FlowDefinitionArn='arn:aws:sagemaker:aws-region:xyz:flow-definition/flow_def_name',
    HumanLoopInput={
        'InputContent': '{"InputContent": "{\"prompt\": \"What is the answer?\"}"}'
    },
    DataAttributes={
        'ContentClassifiers': [
            'FreeOfPersonallyIdentifiableInformation' | 'FreeOfAdultContent',
        ]
    }
)
```

### Amazon CLI

The following request example uses the Amazon CLI. For more information, see [start-human-loop](#) in the [Amazon CLI Command Reference](#).

```
$ aws sagemaker-a2i-runtime start-human-loop
  --flow-definition-arn 'arn:aws:sagemaker:aws_region:xyz:flow-
definition/flow_def_name' \
  --human-loop-name 'human_loop_name' \
  --human-loop-input '{"InputContent": "{\"prompt\": \"What is the answer?\"}"}' \
  --data-attributes
  ContentClassifiers="FreeOfPersonallyIdentifiableInformation", "FreeOfAdultContent" \
```

When you successfully start a human loop by invoking `StartHumanLoop` directly, the response includes a `HumanLoopARN` and a `HumanLoopActivationResults` object which is set to `NULL`. You can use this the human loop name to monitor and manage your human loop.

## Next Steps:

After starting a human loop, you can manage and monitor it with the Amazon Augmented AI Runtime API and Amazon CloudWatch Events. To learn more, see [Monitor and Manage Your Human Loop \(p. 2376\)](#).

## Delete a Human Loop

When you delete a human loop, the status changes to `Deleting`. When the human loop is deleted, the associated human review task is no longer available to workers. You might want to delete a human loop in one of the following circumstances:

- The worker task template used to generate your worker user interface does not render correctly or is not functioning as expected.
- A single data object was accidentally sent to workers multiple times.
- You no longer need a data object reviewed by a human.

If the status of a human loop is `InProgress`, you must stop the human loop before deleting it. When you stop a human loop, the status changes to `Stopping` while it is being stopped. When the status changes to `Stopped`, you can delete the human loop.

If human workers are already working on a task when you stop the associated human loop, that task continues to be available until it is completed or expires. As long as workers are still working on a task, your human loop's status is **Stopping**. If these tasks are completed, the results are stored in the Amazon S3 bucket URI specified in your human review workflow. If the worker leaves the task without submitting work, it is stopped and the worker can't return to the task. If no worker has started working on the task, it is stopped immediately.

If you delete the Amazon account used to create the human loop, it is stopped and deleted automatically.

## Human Loop Data Retention and Deletion

When a human worker completes a human review task, the results are stored in the Amazon S3 output bucket you specified in the human review workflow used to create the human loop. Deleting or stopping a human loop does not remove any worker answers from your S3 bucket.

Additionally, Amazon A2I temporarily stores human loop input and output data internally for the following reasons:

- If you configure your human loops so that a single data object is sent to multiple workers for review, Amazon A2I does not write output data to your S3 bucket until all workers have completed the review task. Amazon A2I stores partial answers—answers from individual workers—internally so that it can write full results to your S3 bucket.
- If you report a low-quality human review result, Amazon A2I can investigate and respond to your issue.
- If you lose access to or delete the output S3 bucket specified in the human review workflow used to create a human loop, and the task has already been sent to one or more workers, Amazon A2I needs a place to temporarily store human review results.

Amazon A2I deletes this data internally 30 days after a human loop's status changes to one of the following: **Deleted**, **Stopped**, or **Completed**. In other words, data is deleted 30 days after the human loop has been completed, stopped, or deleted. Additionally, this data is deleted after 30 days if you close the Amazon account used to create associated human loops.

## Stop and Delete a Flow Definition Using the Console or the Amazon A2I API

You can stop and delete a human loop in the Augmented AI console or by using the SageMaker API. When the human loop has been deleted, the status changes to **Deleted**.

### Delete a human loop (console)

1. Navigate to the Augmented AI console at <https://console.amazonaws.cn/a2i/>.
2. In the navigation pane, under the **Augmented AI** section, choose **Human review workflows**.
3. Choose the hyperlinked name of the human review workflow you used to create the human loop you want to delete.
4. In the **Human loops** section at the bottom of the page, select the human loop you want to stop and delete.
5. If the human loop status is **Completed**, **Stopped**, or **Failed**, select **Delete**.

If the human loop **Status** is **InProgress**, select **Stop**. When the status changes to **Stopped**, select **Delete**.

## Delete a human loop (API)

1. Check the status of your human loop using the Augmented AI Runtime API operation [DescribeHumanLoop](#). See examples using this operation in the following table.

### Amazon SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named [\*example-human-loop\*](#). For more information, see [describe\\_human\\_loop](#) in the *Amazon SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.describe_human_loop(HumanLoopName='example-human-loop')
human_loop_status = response['HumanLoopStatus']
print(f'example-human-loop status is: {human_loop_status}')
```

### Amazon CLI

The following example uses the Amazon CLI to describe the human loop named [\*example-human-loop\*](#). For more information, see [describe-human-loop](#) in the *Amazon CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime describe-human-loop --human-loop-name 'example-human-loop'
```

2. If the flow definition status is Completed, Stopped, or Failed, delete the flow definition using the Augmented AI Runtime API operation [DeleteHumanLoop](#).

### Amazon SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to delete the human loop named [\*example-human-loop\*](#). For more information, see [delete\\_human\\_loop](#) in the *Amazon SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.delete_human_loop(HumanLoopName='example-human-loop')
```

### Amazon CLI

The following example uses the Amazon CLI to delete the human loop named [\*example-human-loop\*](#). For more information, see [delete-human-loop](#) in the *Amazon CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime delete-human-loop --human-loop-name 'example-human-loop'
```

If the human loop status is InProgress, stop the human loop using [StopHumanLoop](#) and then use [DeleteHumanLoop](#) to delete it.

### Amazon SDK for Python (Boto3)

The following example uses the SDK for Python (Boto3) to describe the human loop named `example-human-loop`. For more information, see [stop\\_human\\_loop](#) in the *Amazon SDK for Python (Boto) API Reference*.

```
import boto3

a2i_runtime_client = boto3.client('sagemaker-a2i-runtime')
response = a2i_runtime_client.stop_human_loop(HumanLoopName='example-human-loop')
```

### Amazon CLI

The following example uses the Amazon CLI to describe the human loop named `example-human-loop`. For more information, see [stop-human-loop](#) in the *Amazon CLI Command Reference*.

```
$ aws sagemaker-a2i-runtime stop-human-loop --human-loop-name 'example-human-loop'
```

## Create and Manage Worker Task Templates

You can create a task user interface for your workers by creating a *worker task template*. A worker task template is an HTML file that is used to display your input data and instructions to help workers complete your task.

For Amazon Rekognition or Amazon Textract task types, you can customize a pre-made worker task template using a graphical user interface (GUI) and avoid interacting with HTML code. For this option, use the instructions in [Create a Human Review Workflow \(Console\) \(p. 2340\)](#) to create a human review workflow and customize your worker task template in the Amazon SageMaker console. Once you create a template using these instructions, it appears on the worker task templates page of the [Augmented AI console](#).

If you are creating a human review workflow for a custom task type, you must create a *custom worker task template* using HTML code. For more information, see [Create Custom Worker Task Templates \(p. 2368\)](#).

If you create your template using HTML, you must use this template to generate an Amazon A2I *human task UI Amazon Resource Name (ARN)* in the Amazon A2I console. This ARN has the following format: `arn:aws:sagemaker:<aws-region>:<aws-account-number>:human-task-ui/<template-name>`. This ARN is associated with a worker task template resource that you can use in one or more human review workflows (flow definitions).

Generate a human task UI ARN using a worker task template by following the instructions found in [Create a Worker Task Template \(p. 2367\)](#) or by using the `CreateHumanTaskUi` API operation.

### Topics

- [Create and Delete Worker Task Templates \(p. 2366\)](#)
- [Create Custom Worker Task Templates \(p. 2368\)](#)
- [Creating Good Worker Instructions \(p. 2375\)](#)

## Create and Delete Worker Task Templates

You can use a worker template to customize the interface and instructions that your workers see when working on your tasks. Use the instructions on this page to create a worker task template in the

Augmented AI area of the Amazon SageMaker console. A starter template is provided for Amazon Textract and Amazon Rekognition tasks. To learn how to customize your template using HTML crowd elements, see [Create Custom Worker Task Templates \(p. 2368\)](#).

When you create a worker template in the worker task templates page of the Augmented AI area of the SageMaker console, a worker task template ARN is generated. Use this ARN as the input to `HumanTaskUiArn` when you create a flow definition using the API operation [CreateFlowDefinition](#). You can choose this template when creating a human review workflow on the human review workflows page of the console.

If you are creating a worker task template resource for an Amazon Textract or Amazon Rekognition task type, you can preview the worker UI that is generated from your template on the worker task templates console page. You must attach the policy described in [Enable Worker Task Template Previews \(p. 2390\)](#) to the IAM role that you use to preview the template.

## Create a Worker Task Template

You can create a worker task template using the SageMaker console and using the SageMaker API operation [CreateHumanTaskUi](#).

### Create a worker task template (console)

1. Open the Amazon A2I console at <https://console.amazonaws.cn/a2i/>.
2. Under **Amazon Augmented AI** in the left navigation pane, choose **Worker task templates**.
3. Choose **Create template**.
4. In **Template name**, enter a unique name.
5. (Optional) Enter an **IAM role** that grants Amazon A2I the permissions necessary to call services on your behalf.
6. In **Template type**, choose a template type from the dropdown list. If you are creating a template for a **Textract-form extraction** or **Rekognition-image moderation** task, choose the appropriate option.
7. Enter your custom template elements as follows:
  - If you selected the Amazon Textract or Amazon Rekognition task template, the **Template editor** autopopulates with a default template that you can customize.
  - If you are using a custom template, enter your predefined template in the editor.
8. (Optional) To complete this step, you must provide an IAM role ARN with permission to read Amazon S3 objects that get rendered on your user interface in **Step 5**.

You can only preview your template if you are creating templates for Amazon Textract or Amazon Rekognition.

Choose **See preview** to preview the interface and instructions that workers see. This is an interactive preview. After you complete the sample task and choose **Submit**, you see the resulting output from the task that you just performed.

If you are creating a worker task template for a custom task type, you can preview your worker task UI using `RenderUiTemplate`. For more information, see [Preview a Worker Task Template \(p. 2375\)](#).

9. When you're satisfied with your template, choose **Create**.

After you've created your template, you can select that template when you create a human review workflow in the console. Your template also appears in the **Amazon Augmented AI** section of the SageMaker console under **Worker task templates**. Choose your template to view its ARN. Use this ARN when using the [CreateFlowDefinition](#) API operation .

### Create a worker task template using a worker task template (API)

To generate a worker task template using the SageMaker API operation [CreateHumanTaskUi](#), specify a name for your UI in `HumanTaskUiName` and input your HTML template in `Content` under `UiTemplate`. Find documentation on language-specific SDKs that support this API operation in the **See Also** section of the [CreateHumanTaskUi](#).

## Delete a Worker Task Template

Once you have created a worker task template, you can delete it using the SageMaker console or the SageMaker API operation [DeleteHumanTaskUi](#).

When you delete a worker task template, you are not able to use human review workflows (flow definitions) created using that template to start human loops. Any human loops that have already been created using the worker task template that you delete continue to be processed until completion and are not impacted.

### Delete a worker task template (console)

1. Open the Amazon A2I console at <https://console.amazonaws.cn/a2i/>.
2. Under Amazon Augmented AI in the left navigation pane, choose **Worker task templates**.
3. Select the template that you want to delete.
4. Select **Delete**.
5. A modal appears to confirm your choice. Select **Delete**.

### Delete a worker task template (API)

To delete a worker task template using the SageMaker API operation [DeleteHumanTaskUi](#), specify a name of your UI in `HumanTaskUiName`.

## Create Custom Worker Task Templates

*Crowd HTML Elements* are web components that provide a number of task widgets and design elements that you can tailor to the question you want to ask. You can use these crowd elements to create a custom worker template and integrate it with an Amazon Augmented AI (Amazon A2I) human review workflow to customize the worker console and instructions.

For a list of all HTML crowd elements available to Amazon A2I users, see [Crowd HTML Elements Reference \(p. 482\)](#). For examples of templates, see the [Amazon GitHub repository](#), which contains over 60 sample custom task templates.

## Develop Templates Locally

When in the console to test how your template processes incoming data, you can test the look and feel of your template's HTML and custom elements in your browser by adding the following code to the top of your HTML file.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
```

This loads the necessary code to render the custom HTML elements. Use this code if you want to develop your template's look and feel in your preferred editor instead of in the console.

This code won't parse your variables. You might want to replace them with sample content while developing locally.

## Use External Assets

Amazon Augmented AI custom templates enable you to embed external scripts and style sheets. For example, the following header embeds a text/css style sheet name `stylesheet` located at `https://www.example.com/my-enhancement-styles.css` into the custom template.

### Example

```
<script src="https://www.example.com/my-enhancement-script.js"></script>
<link rel="stylesheet" type="text/css" href="https://www.example.com/my-enhancement-
styles.css">
```

If you encounter errors, ensure that your originating server is sending the correct MIME type and encoding headers with the assets.

For example, the MIME and encoding type for remote scripts is `application/javascript;CHARSET=UTF-8`.

The MIME and encoding type for remote stylesheets is `text/css;CHARSET=UTF-8`.

## Track Your Variables

When building a custom template, you must add variables to it to represent the pieces of data that might change from task to task, or worker to worker. If you're starting with one of the sample templates, you need to make sure you're aware of the variables it already uses.

For example, for a custom template that integrates an Augmented AI human review loop with a Amazon Textract text review task, `{{ task.input.selectedAiServiceResponse.blocks }}` is used for initial-value input data. For Amazon Augmented AI (Amazon A2I) integration with Amazon Rekognition , `{{ task.input.selectedAiServiceResponse.moderationLabels }}` is used. For a custom task type, you need to determine the input parameter for your task type. Use `{{ task.input.customInputValuesForStartHumanLoop }}` where you specify `customInputValuesForStartHumanLoop`.

## Custom Template Example for Amazon Textract

All custom templates begin and end with the `<crowd-form> </crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements.

For an Amazon Textract document analysis task, use the `<crowd-textract-analyze-document>` element. It uses the following attributes:

- `src` – Specifies the URL of the image file to be annotated.
- `initialValue` – Sets initial values for attributes found in the worker UI.
- `blockTypes` (required) – Determines the kind of analysis that the workers can do. Only `KEY_VALUE_SET` is currently supported.
- `keys` (required) – Specifies new keys and the associated text value that the worker can add.
- `no-key-edit` (required) – Prevents the workers from editing the keys of annotations passed through `initialValue`.
- `no-geometry-edit` – Prevents workers from editing the polygons of annotations passed through `initialValue`.

For children of the `<crowd-textract-analyze-document>` element, you must have two Regions. You can use arbitrary HTML and CSS elements in these Regions.

- <full-instructions> – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- <short-instructions> – A brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

An Amazon Textract template would look similar to the following.

### Example

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{% capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.document.s3Object.bucket }}/
{{ task.input.aiServiceRequest.document.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-extract-analyze-document
    src="{{ s3_uri | grant_read_access }}"
    initial-value="{{ task.input.selectedAiServiceResponse.blocks }}"
    header="Review the key-value pairs listed on the right and correct them if they don't
match the following document."
    no-key-edit
    no-geometry-edit
    keys="{{ task.input.humanLoopContext.importantFormKeys }}"
    block-types="['KEY_VALUE_SET']"
  >
    <short-instructions header="Instructions">
      <style>
        .instructions {
          white-space: pre-wrap;
        }
        .instructionsImage {
          display: inline-block;
          max-width: 100%;
        }
      </style>
      <p class='instructions'>Choose a key-value block to highlight the corresponding key-
value pair in the document.

If it is a valid key-value pair, review the content for the value. If the content is
incorrect, correct it.

The text of the value is incorrect, correct it.

A wrong value is identified, correct it.

If it is not a valid key-value relationship, choose No.

If you can't find the key in the document, choose Key not found.

If the content of a field is empty, choose Value is blank.

<b>Examples</b>
Key and value are often displayed next to or below to each other.

Key and value displayed in one line.

```

```

Key and value displayed in two lines.

If the content of the value has multiple lines, enter all the text without a line break.
Include all value text even if it extends beyond the highlight box.
</p>
</short-instructions>

</crowd-form>

```

## Custom Template Example for Amazon Rekognition

All custom templates begin and end with the `<crowd-form>` `</crowd-form>` elements. Like standard HTML `<form>` elements, all of your form code should go between these elements. For an Amazon Rekognition custom task template, use the `<crowd-rekognition-detect-moderation-labels>` element. This element supports the following attributes:

- `categories` – An array of strings or an array of objects where each object has a `name` field.
  - If the `categories` come in as objects, the following applies:
    - The displayed categories are the value of the `name` field.
    - The returned answer contains the *full* objects of any selected categories.
  - If the `categories` come in as strings, the following applies:
    - The returned answer is an array of all the strings that were selected.
- `exclusion-category` – By setting this attribute, you create a button underneath the categories in the UI. When a user selects the button, all categories are deselected and disabled. If the worker selects the button again, you re-enable users to choose categories. If the worker submits the task by selecting **Submit** after you select the button, that task returns an empty array.

For children of the `<crowd-rekognition-detect-moderation-labels>` element, you must have two Regions.

- `<full-instructions>` – Instructions that are available from the **View full instructions** link in the tool. You can leave this blank, but we recommend that you provide complete instructions to get better results.
- `<short-instructions>` – Brief description of the task that appears in the tool's sidebar. You can leave this blank, but we recommend that you provide complete instructions to get better results.

A template using these elements would look similar to the following.

```

<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
{%
  capture s3_uri %}http://s3.amazonaws.com/
{{ task.input.aiServiceRequest.image.s3Object.bucket }}/
{{ task.input.aiServiceRequest.image.s3Object.name }}{% endcapture %}

<crowd-form>
  <crowd-rekognition-detect-moderation-labels
    categories='[
      {% for label in task.input.selectedAiServiceResponse.moderationLabels %}
        {
          name: "{{ label.name }}",
          parentName: "{{ label.parentName }}",
        },
        {% endfor %}
    ]'

```

```
src="{{ s3_uri | grant_read_access }}"
header="Review the image and choose all applicable categories."
>
<short-instructions header="Instructions">
  <style>
    .instructions {
      white-space: pre-wrap;
    }
  </style>
  <p class='instructions'>Review the image and choose all applicable categories.
  If no categories apply, choose None.

<b>Nudity</b>
Visuals depicting nude male or female person or persons

<b>Graphic Male Nudity</b>
Visuals depicting full frontal male nudity, often close ups

<b>Graphic Female Nudity</b>
Visuals depicting full frontal female nudity, often close ups

<b>Sexual Activity</b>
Visuals depicting various types of explicit sexual activities and pornography

<b>Illustrated Nudity or Sexual Activity</b>
Visuals depicting animated or drawn sexual activity, nudity, or pornography

<b>Adult Toys</b>
Visuals depicting adult toys, often in a marketing context

<b>Female Swimwear or Underwear</b>
Visuals depicting female person wearing only swimwear or underwear

<b>Male Swimwear Or Underwear</b>
Visuals depicting male person wearing only swimwear or underwear

<b>Partial Nudity</b>
Visuals depicting covered up nudity, for example using hands or pose

<b>Revealing Clothes</b>
Visuals depicting revealing clothes and poses, such as deep cut dresses

<b>Graphic Violence or Gore</b>
Visuals depicting prominent blood or bloody injuries

<b>Physical Violence</b>
Visuals depicting violent physical assault, such as kicking or punching

<b>Weapon Violence</b>
Visuals depicting violence using weapons like firearms or blades, such as shooting

<b>Weapons</b>
Visuals depicting weapons like firearms and blades

<b>Self Injury</b>
Visuals depicting self-inflicted cutting on the body, typically in distinctive patterns
using sharp objects

<b>Emaciated Bodies</b>
Visuals depicting extremely malnourished human bodies

<b>Corpses</b>
Visuals depicting human dead bodies

<b>Hanging</b>
Visuals depicting death by hanging</p>
```

```
</short-instructions>

<full-instructions header="Instructions"></full-instructions>
</crowd-rekognition-detect-moderation-labels>
</crowd-form>
```

## Add Automation with Liquid

The custom template system uses [Liquid](#) for automation. *Liquid* is an open-source inline markup language. For more information and documentation, see the [Liquid homepage](#).

In Liquid, the text between single curly braces and percent symbols is an instruction or *tag* that performs an operation like control flow or iteration. Text between double curly braces is a variable or *object* that outputs its value. The following list includes two types of liquid tags that you may find useful to automate template input data processing. If you select one of the following tag-types, you are redirected to the Liquid documentation.

- [Control flow](#): Includes programming logic operators like `if/else`, `unless`, and `case/when`.
- [Iteration](#): Enables you to run blocks of code repeatedly using statements like `for` loops.

For example, the following code example demonstrates how you can use the Liquid `for` tag to create a `for` loop. This example loops through the `moderationLabels` returned from Amazon Rekognition and displays the `moderationLabels` attributes `name` and `parentName` for workers to review:

```
{% for label in task.input.selectedAiServiceResponse.moderationLabels %}
{
    name: "{{ label.name }}",
    parentName: "{{ label.parentName }}",
},
{% endfor %}
```

## Use Variable Filters

In addition to the standard [Liquid filters](#) and actions, Amazon Augmented AI (Amazon A2I) offers additional filters. You apply filters by placing a pipe (|) character after the variable name, and then specifying a filter name. To chain filters, use the following format.

### Example

```
{ {<content> | <filter> | <filter> } }
```

### Autoescape and Explicit Escape

By default, inputs are HTML-escaped to prevent confusion between your variable text and HTML. You can explicitly add the `escape` filter to make it more obvious to someone reading the source of your template that escaping is being done.

#### `escape_once`

`escape_once` ensures that if you've already escaped your code, it doesn't get re-escaped again. For example, it ensures that `&` doesn't become `&amp;`.

#### `skip_autoescape`

`skip_autoescape` is useful when your content is meant to be used as HTML. For example, you might have a few paragraphs of text and some images in the full instructions for a bounding box.

### Note

Use `skip_autoescape` sparingly. As a best practice for templates, avoid passing in functional code or markup with `skip_autoescape` unless you are absolutely sure that you have strict control over what's being passed. If you're passing user input, you could be opening your workers up to a cross-site scripting attack.

### [to\\_json](#)

`to_json` encodes data that you provide to JavaScript Object Notation (JSON). If you provide an object, it serializes it.

### [grant\\_read\\_access](#)

`grant_read_access` takes an Amazon Simple Storage Service (Amazon S3) URI and encodes it into an HTTPS URL with a short-lived access token for that resource. This makes it possible to display photo, audio, or video objects stored in S3 buckets that are not otherwise publicly accessible to workers.

### **Example Example of the `to_json` and `grant_read_access` filters**

#### Input

```
auto-escape: {{ "Have you read 'James & the Giant Peach'?" }}
```

```
explicit escape: {{ "Have you read 'James & the Giant Peach'?" | escape }}
```

```
explicit escape_once: {{ "Have you read 'James & the Giant Peach'?" | escape_once }}
```

```
skip_autoescape: {{ "Have you read 'James & the Giant Peach'?" | skip_autoescape }}
```

```
to_json: {{ jsObject | to_json }}
```

```
grant_read_access: {{ "s3://examplebucket/myphoto.png" | grant_read_access }}
```

#### Example

#### Output

```
auto-escape: Have you read 'James & the Giant Peach'?
```

```
explicit escape: Have you read 'James & the Giant Peach'?
```

```
explicit escape_once: Have you read 'James & the Giant Peach'?
```

```
skip_autoescape: Have you read 'James & the Giant Peach'?
```

```
to_json: { "point_number": 8, "coords": [ 59, 76 ] }
```

```
grant_read_access: https://s3.amazonaws.com/examplebucket/myphoto.png?<access token and other params>
```

### **Example Example of an automated classification template.**

To automate this simple text classification sample, include the Liquid tag `{{ task.input.source }}`. This example uses the [crowd-classifier \(p. 496\)](#) element.

```
<script src="https://assets.crowd.aws/crowd-html-elements.js"></script>
<crowd-form>
  <crowd-classifier
    name="tweetFeeling"
    categories="['positive', 'negative', 'neutral', 'cannot determine']"
    header="Which term best describes this tweet?"
  >
    <classification-target>
      {{ task.input.source }}
    </classification-target>

    <full-instructions header="Analyzing a sentiment">
      Try to determine the feeling the author
    </full-instructions>
  </crowd-classifier>
</crowd-form>
```

```
of the tweet is trying to express.  
If none seems to match, choose "other."  
</full-instructions>  
  
<short-instructions>  
Pick the term that best describes the sentiment  
of the tweet.  
</short-instructions>  
  
</crowd-classifier>  
</crowd-form>
```

## Preview a Worker Task Template

To preview a custom worker task template, use the SageMaker `RenderUiTemplate` operation. You can use the `RenderUiTemplate` operation with the Amazon CLI or your preferred Amazon SDK. For documentation on the supported language specific SDKs for this API operation, see the [See Also](#) section of the [RenderUiTemplate](#).

### Prerequisites

To preview your worker task template, the Amazon Identity and Access Management (IAM) role Amazon Resource Name (ARN), or `RoleArn`, that you use must have permission to access to the S3 objects that are used by the template. To learn how to configure your role or user see [Enable Worker Task Template Previews \(p. 2390\)](#).

### To preview your worker task template using the `RenderUiTemplate` operation:

1. Provide a `RoleArn` of the role with required policies attached to preview your custom template.
2. In the `Input` parameter of `Task`, provide a JSON object that contains values for the variables defined in the template. These are the variables that are substituted for the `task.input.source` variable. For example, if you define a `task.input.text` variable in your template, you can supply the variable in the JSON object as `text: sample text`.
3. In the `Content` parameter of `UiTemplate`, insert your template.

Once you've configured `RenderUiTemplate`, use your preferred SDK or the Amazon CLI to submit a request to render your template. If your request was successful, the response includes `RenderedContent`, a Liquid template that renders the HTML for the worker UI.

### Important

To preview your template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. For a sample policy that you can attach to your IAM role to grant these permissions, see [Enable Worker Task Template Previews \(p. 2390\)](#).

## Creating Good Worker Instructions

Creating good instructions for your human review jobs improves your worker's accuracy in completing their task. You can modify the default instructions that are provided in the console when creating a human review workflow, or you can use the console to create a custom worker template and include your instructions in this template. The instructions are shown to the worker on the UI page where they complete their labeling task.

## Create Good Worker Instructions

There are three kinds of instructions in the Amazon Augmented AI console:

- **Task Description** – The description should provide a succinct explanation of the task.
- **Instructions** – These instructions are shown on the same webpage where workers complete a task. These instructions should provide an easy reference to show the worker the correct way to complete the task.
- **Additional Instructions** – These instructions are shown in a dialog box that appears when a worker chooses **View full instructions**. We recommend that you provide detailed instructions for completing the task, and include several examples showing edge cases and other difficult situations for labeling objects.

## Add Example Images to Your Instructions

Images provide useful examples for your workers. To add a publicly accessible image to your instructions, do the following:

1. Place the cursor where the image should go in the instructions editor.
2. Choose the image icon in the editor toolbar.
3. Enter the URL of your image.

If your instruction image is in an S3 bucket that isn't publicly accessible, do the following:

- For the image URL, enter: `{} 'https://s3.amazonaws.com/your-bucket-name/image-file-name' | grant_read_access {}`.

This renders the image URL with a short-lived, one-time access code that's appended so the worker's browser can display it. A broken image icon is displayed in the instructions editor, but previewing the tool displays the image in the rendered preview. See [grant\\_read\\_access \(p. 2374\)](#) for more information about the `grant_read_access` element.

## Monitor and Manage Your Human Loop

Once you've started a human review loop, you can check the results of tasks sent to the loop and manage it using the [Amazon Augmented AI Runtime API](#). Additionally, Amazon A2I integrates with Amazon EventBridge (also known as Amazon CloudWatch Events) to alert you when a human review loop status changes to `Completed`, `Failed`, or `Stopped`. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to EventBridge.

Use the procedures below to learn how to use the Amazon A2I Runtime API to monitor and manage your human loops. See [Use Amazon CloudWatch Events in Amazon Augmented AI \(p. 2392\)](#) to learn how Amazon A2I integrates with Amazon EventBridge.

### To check your output data:

1. Check the results of your human loop by calling the `DescribeHumanLoop` operation. The result of this API operation contains information about the reason for and outcome of the loop activation.
2. Check the output data from your human loop in Amazon Simple Storage Service (Amazon S3). In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (`YYYY`), month (`MM`), and day (`DD`), and the creation time with hour (`hh`), minute (`mm`), and second (`ss`).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-  
name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

You can integrate this structure with Amazon Glue or Amazon Athena to partition and analyze your output data. For more information, see [Managing Partitions for ETL Output in Amazon Glue](#).

To learn more about Amazon A2I output data format, see [Amazon A2I Output Data \(p. 2377\)](#).

#### To stop and delete your human loop:

1. Once a human loop has been started, you can stop your human loop by calling the [StopHumanLoop](#) operation using the `HumanLoopName`. If a human loop was successfully stopped, the server sends back an HTTP 200 response.
2. To delete a human loop for which the status equals `Failed`, `Completed`, or `Stopped`, use the [DeleteHumanLoop](#) operation.

#### To list human loops:

1. You can list all active human loops by calling the [ListHumanLoops](#) operation. You can filter human loops by the creation date of the loop using the `CreationTimeAfter` and `CreateTimeBefore` parameters.
2. If successful, `ListHumanLoops` returns `HumanLoopSummaries` and `NextToken` objects in the response element. `HumanLoopSummaries` contains information about a single human loop. For example, it lists a loop's status and, if applicable, its failure reason.

Use the string returned in `NextToken` as an input in a subsequent call to `ListHumanLoops` to see the next page of human loops.

## Amazon A2I Output Data

When your machine learning workflow sends Amazon A2I a data object, a *human loop* is created and human reviewers receive a *task* to review that data object. The output data from each human review task is stored in the Amazon Simple Storage Service (Amazon S3) output bucket you specify in your human review workflow. In the path to the data, `YYYY/MM/DD/hh/mm/ss` represents the human loop creation date with year (`YYYY`), month (`MM`), and day (`DD`), and the creation time with hour (`hh`), minute (`mm`), and second (`ss`).

```
s3://customer-output-bucket-specified-in-flow-definition/flow-definition-name/YYYY/MM/DD/hh/mm/ss/human-loop-name/output.json
```

The content of your output data depends on the type of [task type](#) (built-in or custom) and the type of [workforce](#) you use. Your output data always includes the response from the human worker. Additionally, output data may include metadata about the human loop, the human reviewer (worker), and the data object.

Use the following sections to learn more about Amazon A2I output data format for different task types and workforces.

## Output Data From Built-In Task Types

Amazon A2I built-in task types include Amazon Textract and Amazon Rekognition. In addition to human responses, the output data from one of these tasks includes details about the reason the human loop was created and information about the integrated service used to create the human loop. Use the following table to learn more about the output data schema for all built-in task types. The *value* for each of these parameters depends on the service you use with Amazon A2I. Refer to the second table in this section for more information about these service-specific values.

Parameter	Value Type	Example Values	Description
awsManagedHumanLoopRequestSource	String	AWS/Rekognition/DetectModerationLabelsImage/V3 or AWS/Texttract/AnalyzeDocument/Forms/V1	The API operation and associated Amazon services that requested that Amazon A2I create the a human loop. This is the API operation you use to configure your Amazon A2I human loop.
flowDefinitionArn	String	arn:aws:sagemaker:us-west-2:111122223333:definition/flow-definition-name	The Amazon Resource Number (ARN) of the human review workflow (flow definition) used to create the human loop.
humanAnswers	List of JSON objects	<pre>{   "answerContent": {     "AWS/Rekognition/DetectModerationLabelsImage/V3": {       "moderationLabels": [         ...       }     },     ...   } }</pre> <p>or</p> <pre>{   "answerContent": {     "AWS/Texttract/AnalyzeDocument/Forms/V1": {       "blocks": [         ...       }     },     ...   } }</pre>	<p>A list of JSON objects that contain worker responses in <code>/answerContent</code>. This object also contains submission details and, if a private workforce was used, worker metadata. To learn more, see <a href="#">Track Worker Activity (p. 2385)</a>.</p> <p>For human loop output data produced from Amazon Rekognition DetectModerationLabel review tasks, this parameter only contains positive responses. For example, if workers select <i>No content</i>, this response is not included.</p>
humanLoopName	String	'human-loop-name'	The name of the human loop.
inputContent	JSON object	<pre>{   "aiServiceRequest": {...},   "aiServiceResponse": {...},   "humanTaskActivationConditionResults": {...} }</pre>	The input content the Amazon service sent to Amazon A2I when it requested a human loop be created.

Parameter	Value Type	Example Values	Description
		<pre>"selectedAiServiceResponse": { ... }</pre>	
aiServiceRequest	JSON object	<pre>{     "document": { ... },     "featureTypes": [ ... ],     "humanLoopConfig": { ... } }</pre> <p>or</p> <pre>{     "image": { ... },     "humanLoopConfig": { ... } }</pre>	The original request sent to the Amazon service integrated with Amazon A2I. For example, if you use Amazon Rekognition with Amazon A2I, this includes the request made through the API operation <code>DetectModerationLabels</code> . For Amazon Textract integrations, this includes the request made through <code>AnalyzeDocument</code> .
aiServiceResponse	JSON object	<pre>{     "moderationLabels": [ ... ],     "moderationModelVersion": "3.0" }</pre> <p>or</p> <pre>{     "blocks": [ ... ],     "documentMetadata": { } }</pre>	The full response from the Amazon service. This is the data that is used to determine if a human review is required. This object may contain metadata about the data object that is not shared with human reviewers.

Parameter	Value Type	Example Values	Description
selectedAiServiceResponse	JSON object	<pre>{     "moderationLabels": [...],     "moderationModelVersion": "3.0" }</pre> <p>or</p> <pre>{     "blocks": [...],     "documentMetadata": {} }</pre>	The subset of the aiServiceResponse that matches the activation conditions in ActivationConditions. All data objects listed in aiServiceResponse are listed in selectedAiServiceResponse when inferences are randomly sampled, or all inferences initiated activation conditions.
humanTaskActivationResults	JSON object	<pre>{     "Conditions": [...] }</pre>	A JSON object in inputContent that contains the reason a human loop was created. This includes a list of the activation conditions (Conditions) included in your human review workflow (flow definition), and the evaluation result for each condition—this result is either true or false. To learn more about activation conditions, see <a href="#">JSON Schema for Human Loop Activation Conditions in Amazon Augmented AI (p. 2345)</a> .

Select a tab on the following table to learn about the task type–specific parameters and see an example output-data code block for each of the built-in task types.

#### Amazon Textract Task Type Output Data

When you use the Amazon Textract built-in integration, you see 'AWS/Textract/AnalyzeDocument/Forms/V1' as the value for awsManagedHumanLoopRequestSource in your output data.

The answerContent parameter contains a Block object that includes human responses for all blocks sent to Amazon A2I.

The aiServiceResponse parameter also includes a Block object with Amazon Textract's response to the original request sent using to AnalyzeDocument.

To learn more about the parameters you see in the block object, refer to [Block](#) in the [Amazon Textract Developer Guide](#).

The following is an example of the output data from an Amazon A2I human review of Amazon Textract document analysis inferences.

```
{
    "awsManagedHumanLoopRequestSource": "AWS/Textract/AnalyzeDocument/Forms/V1",
    "flowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
    "humanAnswers": [
        {
            "answerContent": {
                "AWS/Textract/AnalyzeDocument/Forms/V1": {
                    "blocks": [...]
                }

## Amazon Rekognition Task Type Output Data

When you use the Amazon Textract built-in integration, you see the string 'AWS/Rekognition/DetectModerationLabels/Image/V3' as the value for `awsManagedHumanLoopRequestSource` in your output data.

The `answerContent` parameter contains a `moderationLabels` object that contains human responses for all moderation labels sent to Amazon A2I.

The `aiServiceResponse` parameter also includes a `moderationLabels` object with Amazon Rekognition's response to the original request sent to `DetectModerationLabels`.

To learn more about the parameters you see in the block object, refer to [ModerationLabel](#) in the Amazon Rekognition Developer Guide.

The following is an example of the output data from an Amazon A2I human review of Amazon Rekognition image moderation inferences.

```
V3",
    "flowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-
definition/flow-definition-name",
    "humanAnswers": [
        {
            "answerContent": {
```

```

    "AWS/Rekognition/DetectModerationLabels/Image/V3": {
        "moderationLabels": [...]
    }
},
"submissionTime": "2020-09-28T19:22:35.508Z",

```

```

        }
    ],
    "moderationModelVersion": "3.0"
}
}
}
```

## Output Data From Custom Task Types

When you add Amazon A2I to a custom human review workflow, you see the following parameters in the output data returned from human review tasks.

Parameter	Value Type	Description
<code>flowDefinitionArn</code>	String	The Amazon Resource Number (ARN) of the human review workflow (flow definition) used to create the human loop.
<code>humanAnswers</code>	List of JSON objects	A list of JSON objects that contain worker responses in <code>answerContent</code> . The value in this parameter is determined by the output received from your <a href="#">worker task template</a> .  If you are using a private workforce, worker metadata is included. To learn more, see <a href="#">Track Worker Activity (p. 2385)</a> .
<code>humanLoopName</code>	String	The name of the human loop.
<code>inputContent</code>	JSON Object	The input content sent to Amazon A2I in the request to <a href="#">StartHumanLoop</a> .

The following is an example of output data from a custom integration with Amazon A2I and Amazon Transcribe. In this example, the `inputContent` consists of:

- A path to an .mp4 file in Amazon S3 and the video title
- The transcription returned from Amazon Transcribe (parsed from Amazon Transcribe output data)
- A start and end time used by the worker task template to clip the .mp4 file and show workers a relevant portion of the video

```

{
    "flowDefinitionArn": "arn:aws:sagemaker:us-west-2:111122223333:flow-definition/flow-definition-name",
    "humanAnswers": [
        {
            "answerContent": {
                "transcription": "use lambda to turn your notebook"
            },
            "submissionTime": "2020-06-18T17:08:26.246Z",
            "workerId": "ef7294f850a3d9d1",

```

```

        "workerMetadata": {
            "identityData": {
                "identityProviderType": "Cognito",
                "issuer": "https://cognito-idp.us-west-2.amazonaws.com/us-
west-2_111111",
                "sub": "c6aa8eb7-9944-42e9-a6b9-111122223333"
            }
        }

    ],
    "humanLoopName": "human-loop-name",
    "inputContent": {
        "audioPath": "s3://a2i_transcribe_demo/Fully-Managed Notebook Instances with
Amazon SageMaker - a Deep Dive.mp4",
        "end_time": 950.27,
        "original_words": "but definitely use Lambda to turn your ",
        "start_time": 948.51,
        "video_title": "Fully-Managed Notebook Instances with Amazon SageMaker - a Deep
Dive.mp4"
    }
}

```

## Track Worker Activity

Amazon A2I provides information that you can use to track individual workers in task output data. To identify the worker that worked on the human review task, use the following from the output data in Amazon S3:

- The `acceptanceTime` is the time that the worker accepted the task. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`), and millisecond (`mmm`). The date and time are separated by a `T`.
- The `submissionTime` is the time that the worker submitted their annotations using the **Submit** button. The format of this date and time stamp is `YYYY-MM-DDTHH:MM:SS.mmmZ` for the year (`YYYY`), month (`MM`), day (`DD`), hour (`HH`), minute (`MM`), second (`SS`), and millisecond (`mmm`). The date and time are separated by a `T`.
- `timeSpentInSeconds` reports the total time, in seconds, that a worker actively worked on that task. This metric does not include time when a worker paused or took a break.
- The `workerId` is unique to each worker.
- If you use a [private workforce](#), in `workerMetadata`, you see the following.
  - The `identityProviderType` is the service used to manage the private workforce.
  - The `issuer` is the Amazon Cognito user pool or OpenID Connect (OIDC) Identity Provider (IdP) issuer associated with the work team assigned to this human review task.
  - A unique `sub` identifier refers to the worker. If you create a workforce using Amazon Cognito, you can retrieve details about this worker (such as the name or user name) associated with this ID using Amazon Cognito. To learn how, see [Managing and Searching for User Accounts in Amazon Cognito Developer Guide](#).

The following is an example of the output you may see if you use Amazon Cognito to create a private workforce. This is identified in the `identityProviderType`.

```

"submissionTime": "2020-12-28T18:59:58.321Z",
"acceptanceTime": "2020-12-28T18:59:15.191Z",
"timeSpentInSeconds": 40.543,
"workerId": "a12b3cdefg4h5i67",
"workerMetadata": {
    "identityData": {

```

```
        "identityProviderType": "Cognito",
        "issuer": "https://cognito-idp..amazonaws.com/aws-region_123456789",
        "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeee"
    }
}
```

The following is an example of the output you may see if you use your own OIDC IdP to create a private workforce:

```
"workerMetadata": {
    "identityData": {
        "identityProviderType": "Oidc",
        "issuer": "https://example-oidc-ipd.com/adfs",
        "sub": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeee"
    }
}
```

To learn more about using private workforces, see [Use a Private Workforce \(p. 461\)](#).

## Permissions and Security in Amazon Augmented AI

When using Amazon Augmented AI (Amazon A2I) to create a human review workflow for your ML/AI application, you create and configure *resources* in Amazon SageMaker such as a human workforce and worker task templates. To configure and start a human loop, you either integrate Amazon A2I with other Amazon services such as Amazon Textract or Amazon Rekognition, or use the Amazon Augmented AI Runtime API. To create a human review workflow and start a human loop, you must attach certain policies to your Amazon Identity and Access Management (IAM) role or user. Specifically:

- When you start a human loop using image input data on or after January 12th, 2020, you must add a CORS header policy to the Amazon S3 bucket that contains your input data. See [CORS Permission Requirement \(p. 2387\)](#) to learn more.
- When you create a flow definition, you need to provide a role that grants Amazon A2I permission to access Amazon S3 both for reading objects that are rendered in a human task UI and for writing the results of the human review.

This role must also have a trust policy attached to give SageMaker permission to assume the role. This allows Amazon A2I to perform actions in accordance with permissions that you attach to the role.

See [Add Permissions to the IAM Role Used to Create a Flow Definition \(p. 2388\)](#) for example policies that you can modify and attach to the role you use to create a flow definition. These are the policies that are attached to the IAM role that is created in the **Human review workflows** section of the Amazon A2I area of the SageMaker console.

- To create and start human loops, you either use an API operation from a built-in task type (such as `DetectModerationLabel` or `AnalyzeDocument`) or the Amazon A2I Runtime API operation `StartHumanLoop` in a custom ML application. You need to attach the `AmazonAugmentedAIFullAccess` managed policy to the IAM user that invokes these API operations to grant permission to these services to use Amazon A2I operations. To learn how, see [Create an IAM User That Can Invoke Amazon A2I API Operations \(p. 2389\)](#).

This policy does *not* grant permission to invoke the API operations of the Amazon service associated with built-in task types. For example, `AmazonAugmentedAIFullAccess` does not grant permission to call the Amazon Rekognition `DetectModerationLabel` API operation or Amazon Textract `AnalyzeDocument` API operation. You can use the more general policy, `AmazonAugmentedAIIntegratedAPIAccess`, to grant these permissions. For more information, see [Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon](#)

[Rekognition API Operations \(p. 2390\)](#). This is a good option when you want to grant an IAM user broad permissions to use Amazon A2I and integrated Amazon services' API operations.

If you want to configure more granular permissions, see [Amazon Rekognition Identity-Based Policy Examples](#) and [Amazon Textract Identity-Based Policy Examples](#) for identity-based policies you can use to grant permission to use these individual services.

- To preview your custom worker task UI template, you need an IAM role with permissions to read Amazon S3 objects that get rendered on your user interface. See a policy example in [Enable Worker Task Template Previews \(p. 2390\)](#).

## CORS Permission Requirement

Earlier in 2020, widely used browsers like Chrome and Firefox changed their default behavior for rotating images based on image metadata, referred to as [EXIF data](#). Previously, images would always display in browsers exactly how they are stored on disk, which is typically unrotated. After the change, images now rotate according to a piece of image metadata called *orientation value*. This has important implications for the entire machine learning (ML) community. For example, if the EXIF orientation is not considered, applications that are used to annotate images may display images in unexpected orientations and result in incorrect labels.

Starting with Chrome 89, Amazon can no longer automatically prevent the rotation of images because the web standards group W3C has decided that the ability to control rotation of images violates the web's Same-Origin Policy. Therefore, to ensure human workers annotate your input images in a predictable orientation when you submit requests to create a human loop, you must add a CORS header policy to the S3 buckets that contain your input images.

#### Important

If you do not add a CORS configuration to the S3 buckets that contains your input data, human review tasks for those input data objects fail.

You can add a CORS policy to an S3 bucket that contains input data in the Amazon S3 console. To set the required CORS headers on the S3 bucket that contains your input images in the S3 console, follow the directions detailed in [How do I add cross-domain resource sharing with CORS?](#). Use the following CORS configuration code for the buckets that host your images. If you use the Amazon S3 console to add the policy to your bucket, you must use the JSON format.

#### JSON

```
[  
  {  
    "AllowedHeaders": [],  
    "AllowedMethods": ["GET"],  
    "AllowedOrigins": ["*"],  
    "ExposeHeaders": []  
  }]
```

#### XML

```
<CORSConfiguration>
  <CORSRule>
    <AllowedOrigin>*</AllowedOrigin>
    <AllowedMethod>GET</AllowedMethod>
  </CORSRule>
</CORSConfiguration>
```

## Add Permissions to the IAM Role Used to Create a Flow Definition

To create a flow definition, attach the policies in this section to the role that you use when creating a human review workflow in the SageMaker console, or when using the `CreateFlowDefinition` API operation.

- If you are using the console to create a human review workflow, enter the role Amazon Resource Name (ARN) in the **IAM role** field when [creating a human review workflow in the console](#).
- When creating a flow definition using the API, attach these policies to the role that is passed to the `RoleArn` parameter of the `CreateFlowDefinition` operation.

When you create a human review workflow (flow definition), Amazon A2I invokes Amazon S3 to complete your task. To grant Amazon A2I permission to retrieve and store your files in your Amazon S3 bucket, create the following policy and attach it to your role. For example, if the images, documents, and other files that you are sending for human review are stored in an S3 bucket named `my_input_bucket`, and if you want the human reviews to be stored in a bucket named `my_output_bucket`, create the following policy.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:GetObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_input_bucket/*"
      ]
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::my_output_bucket/*"
      ]
    }
  ]
}
```

In addition, the IAM role must have the following trust policy to give SageMaker permission to assume the role. To learn more about IAM trust policies, see [Resource-Based Policies](#) section of **Policies and Permissions** in the *Amazon Identity and Access Management* documentation.

```
{
```

```
"Version": "2012-10-17",
"Statement": [
  {
    "Sid": "AllowSageMakerToAssumeRole",
    "Effect": "Allow",
    "Principal": {
      "Service": "sagemaker.amazonaws.com"
    },
    "Action": "sts:AssumeRole"
  }
]
```

For more information about creating and managing IAM roles and policies, see the following topics in the *Amazon Identity and Access Management User Guide*:

- To create an IAM role, see [Creating a Role to Delegate Permissions to an IAM User](#).
- To learn how to create IAM policies, see [Creating IAM Policies](#).
- To learn how to attach an IAM policy to a role, see [Adding and Removing IAM Identity Permissions](#).

## Create an IAM User That Can Invoke Amazon A2I API Operations

To use Amazon A2I to create and start human loops for Amazon Rekognition, Amazon Textract, or the Amazon A2I runtime API, you must use an IAM user that has permissions to invoke Amazon A2I operations. To do this, use the IAM console to attach the [AmazonAugmentedAIFullAccess](#) managed policy to a new or existing IAM user.

This policy grants permission to an IAM user to invoke API operations from the SageMaker API for flow definition creation and management and the Amazon Augmented AI Runtime API for human loop creation and management. To learn more about these API operations, see [Use APIs in Amazon Augmented AI](#).

[AmazonAugmentedAIFullAccess](#) does not grant permissions to use Amazon Rekognition or Amazon Textract API operations.

### Note

You can also attach the [AmazonAugmentedAIFullAccess](#) policy to an IAM role that is used to create and start a human loop.

### To create the required IAM user

1. Sign in to the IAM console at <https://console.amazonaws.cn/iam/>.
2. Choose **Users** and choose an existing user, or create a new user by choosing **Add user**. To learn how to create a new user, see [Creating an IAM User in Your Amazon Account](#) in the *Amazon Identity and Access Management User Guide*.
  - If you chose to attach the policy to an existing user, choose **Add permissions**.
  - While creating a new user, follow the next step on the **Set permissions** page.
3. Choose **Attach existing policies directly**.
4. In the **Search** bar, enter [AmazonAugmentedAIFullAccess](#) and check the box next to that policy.

To enable this IAM user to create a flow definition with the public work team, also attach the [AmazonSageMakerMechanicalTurkAccess](#) managed policy.
5. After attaching the policy or policies:

- a. If you are using an existing user, choose **Next: Review**, and then choose **Add permissions**.
- b. If you are creating a new user, choose **Next: Tags** and complete the process of creating your user.

For more information, see [Adding and Removing IAM Identity Permissions](#) in the *Amazon Identity and Access Management User Guide*.

## Create an IAM User With Permissions to Invoke Amazon A2I, Amazon Textract, and Amazon Rekognition API Operations

To create an IAM user that has permission to invoke the API operations used by the built-in task types (that is, `DetectModerationLabels` for Amazon Rekognition and `AnalyzeDocument` for Amazon Textract) and permission to use all Amazon A2I API operations, attach the IAM managed policy, `AmazonAugmentedAIIIntegratedAPIAccess`. You may want to use this policy when you want to grant broad permissions to an IAM user using Amazon A2I with more than one task type. To learn more about these API operations, see [Use APIs in Amazon Augmented AI](#).

**Note**

You can also attach the `AmazonAugmentedAIIIntegratedAPIAccess` policy to an IAM role that is used to create and start a human loop.

### To create the required IAM user

1. Sign in to the IAM console at <https://console.amazonaws.cn/iam/>.
2. Choose **Users** and choose an existing user, or create a new user by choosing **Add user**. To learn how to create a new user, see [Creating an IAM User in Your Amazon Account](#) in the *Amazon Identity and Access Management User Guide*.

- If you chose to attach the policy to an existing user, choose **Add permissions**.
- If you are creating a new user, follow the next step on the **Set permissions** page.

3. Choose **Attach existing policies directly**.

4. In the **Search** bar, enter `AmazonAugmentedAIIIntegratedAPIAccess` and select the box next to that policy.

To allow this IAM user to create a flow definition using Amazon Mechanical Turk, also attach the `AmazonSageMakerMechanicalTurkAccess` managed policy.

5. After attaching the policy or policies:

- a. If you are using an existing user, choose **Next: Review**, and then choose **Add permissions**.
- b. If you are creating a new user, choose **Next: Tags** and complete the process of creating your user.

For more information, see [Adding and Removing IAM Identity Permissions](#) in the *Amazon Identity and Access Management User Guide*.

## Enable Worker Task Template Previews

To customize the interface and instructions that your workers see when working on your tasks, you create a worker task template. You can create the template using the `CreateHumanTaskUi` operation or the SageMaker console.

To preview your template, you need an IAM role with the following permissions to read Amazon S3 objects that get rendered on your user interface.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::my_input_bucket/*"
            ]
        }
    ]
}
```

For Amazon Rekognition and Amazon Textract task types, you can preview your template using the Amazon Augmented AI section of the SageMaker console. For custom task types, you preview your template by invoking the [RenderUiTemplate](#) operation. To preview your template, follow the instructions for your task type:

- Amazon Rekognition and Amazon Textract task types – In the SageMaker console, use the role's Amazon Resource Name (ARN) in the procedure documented in [Create a Worker Task Template \(p. 2367\)](#).
- Custom task types – In the `RenderUiTemplate` operation, use the role's ARN in the `RoleArn` parameter.

## Using Amazon A2I with Amazon KMS Encrypted Buckets

If you specify an Amazon KMS customer managed CMK to encrypt output data in `outputConfig` of [CreateFlowDefinition](#), you must add an IAM policy similar to the following to that key. This policy gives the IAM execution role that you use to create your human loops permission to use this key to perform all of the actions listed in "Action". To learn more about these actions, see [Amazon KMS permissions](#) in the Amazon Key Management Service Developer Guide.

To use this policy, replace the IAM service-role ARN in "Principal" with the ARN of the execution role you use to create the human review workflow (flow definition). When you create a labeling job using `CreateFlowDefinition`, this is the ARN you specify for `RoleArn`. Note that you cannot provide a `KmsKeyId` when you create a human loop in the console.

```
{
    "Sid": "AllowUseOfKmsKey",
    "Effect": "Allow",
    "Principal": {
        "AWS": "arn:aws:iam::111122223333:role/service-role/example-role"
    },
    "Action": [
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt*",
        "kms:GenerateDataKey*",
        "kms:DescribeKey"
    ],
    "Resource": "*"
}
```

}

## Additional Permissions and Security Resources

- the section called “Control Access to SageMaker Resources by Using Tags” (p. 2444).
- the section called “SageMaker Identity-Based Policies” (p. 2421)
- the section called “Control Creation of SageMaker Resources with Condition Keys” (p. 2434)
- the section called “Amazon SageMaker API Permissions Reference” (p. 2474)
- *Security* (p. 2410)

## Use Amazon CloudWatch Events in Amazon Augmented AI

Amazon Augmented AI uses Amazon CloudWatch Events to alert you when a human review loop status changes to Completed, Failed, or Stopped. This event delivery is guaranteed at least once, which means all events created when human loops finish are successfully delivered to CloudWatch Events (Amazon EventBridge). When a review loop changes to one of these states, Augmented AI sends an event to CloudWatch Events similar to the following.

```
{  
    "version": "0",  
    "id": "12345678-1111-2222-3333-12345EXAMPLE",  
    "detail-type": "SageMaker A2I HumanLoop Status Change",  
    "source": "aws.sagemaker",  
    "account": "111111111111",  
    "time": "2019-11-14T17:49:25Z",  
    "region": "us-east-1",  
    "resources": ["arn:aws:sagemaker:us-east-1:111111111111:human-loop/humanloop-nov-14-1"],  
    "detail": {  
        "creationTime": "2019-11-14T17:37:36.740Z",  
        "failureCode": null,  
        "failureReason": null,  
        "flowDefinitionArn": "arn:aws:sagemaker:us-east-1:111111111111:flow-definition/  
flowdef-nov-12",  
        "humanLoopArn": "arn:aws:sagemaker:us-east-1:111111111111:human-loop/humanloop-  
nov-14-1",  
        "humanLoopName": "humanloop-nov-14-1",  
        "humanLoopOutput": {  
            "outputS3Uri": "s3://customer-output-bucket-specified-in-flow-definition/  
flowdef-nov-12/2019/11/14/17/37/36/humanloop-nov-14-1/output.json"  
        },  
        "humanLoopStatus": "Completed"  
    }  
}
```

The details in the JSON output include the following:

**creationTime**

The timestamp when Augmented AI created the human loop.

**failureCode**

A failure code denoting a specific type of failure.

**failureReason**

The reason why a human loop has failed. The failure reason is only returned when the human review loop status is failed.

**flowDefinitionArn**

The Amazon Resource Name (ARN) of the flow definition, or *human review workflow*.

**humanLoopArn**

The Amazon Resource Name (ARN) of the human loop.

**humanLoopName**

The name of the human loop.

**humanLoopOutput**

An object containing information about the output of the human loop.

**outputS3Uri**

The location of the Amazon S3 object where Augmented AI stores your human loop output.

**humanLoopStatus**

The status of the human loop.

## Send Events from Your Human Loop to CloudWatch Events

To configure a CloudWatch Events rule to get status updates, or *events*, for your Amazon A2I human loops, use the Amazon Command Line Interface (Amazon CLI) [put-rule](#) command. When using the [put-rule](#) command, specify the following to receive human loop statuses:

- `\\"source\\":[\\\"aws.sagemaker\\\"]`
- `\\"detail-type\\":[\\\"SageMaker A2I HumanLoop Status Change\\\"]`

To configure a CloudWatch Events rule to watch for all status changes, use the following command and replace the placeholder text. For example, replace [`"A2IHumanLoopStatusChanges"`](#) with a unique CloudWatch Events rule name and [`"arn:aws:iam::111122223333:role/MyRoleForThisRule"`](#) with the Amazon Resource Number (ARN) of an IAM role with an `events.amazonaws.com` trust policy attached. Replace `region` with the Amazon Region in which you want to create the rule.

```
aws events put-rule --name "A2IHumanLoopStatusChanges"
  --event-pattern "\\"source\\":[\\\"aws.sagemaker\\\"], \\"detail-type\\":[\\\"SageMaker A2I HumanLoop Status Change\\\"]"
  --role-arn "arn:aws:iam::111122223333:role/MyRoleForThisRule"
  --region "region"
```

To learn more about the `put-rule` request, see [Event Patterns in CloudWatch Events](#) in the *Amazon CloudWatch Events User Guide*.

## Set Up a Target to Process Events

To process events, you need to set up a target. For example, if you want to receive an email when a human loop status changes, use a procedure in [Setting Up Amazon SNS Notifications](#) in the *Amazon*

*CloudWatch User Guide* to set up an Amazon SNS topic and subscribe your email to it. Once you have created a topic, you can use it to create a target.

### To add a target to your CloudWatch Events rule

1. Open the CloudWatch console: <https://console.amazonaws.cn/cloudwatch/home>
2. In the navigation pane, choose **Rules**.
3. Choose the rule to which you want to add a target.
4. Choose **Actions**, and then choose **Edit**.
5. Under **Targets**, choose **Add Target** and choose the Amazon service you want to act when a human loop status change event is detected.
6. Configure your target. For instructions, see the topic for configuring a target in the [Amazon documentation for that service](#).
7. Choose **Configure details**.
8. For **Name**, enter a name and, optionally, provide details about the purpose of the rule in **Description**.
9. Make sure that the check box next to **State** is selected so that your rule is listed as **Enabled**.
10. Choose **Update rule**.

## Use Human Review Output

After you receive human review results, you can analyze the results and compare them to machine learning predictions. The JSON that is stored in the Amazon S3 bucket contains both the machine learning predictions and the human review results.

## More Information

[Automating Amazon SageMaker with Amazon EventBridge \(p. 2537\)](#)

## Use APIs in Amazon Augmented AI

You can create a human review workflow or a worker task template programmatically. The APIs you use depend on whether you are creating a Amazon Rekognition, Amazon Textract, or custom task type. This topic provides links to API reference documentation for each task type and programming task.

The following APIs can be used with Augmented AI:

### Amazon Augmented AI

Use the Augmented AI API to start, stop, and delete human review loops. You can also list all human review loops and return information about human review loops in your account.

Learn more about human review loop APIs in the [Amazon Augmented AI Runtime API Reference](#).

### Amazon Rekognition

Use the **HumanLoopConfig** parameter of the [`DetectModerationLabels`](#) API to initiate a human review workflow using Amazon Rekognition.

### Amazon SageMaker

Use the Amazon SageMaker API to create a `FlowDefinition`, also known as a *human review workflow*. You can also create a `HumanTaskUi` or `worker task template`.

For more information, see the [CreateFlowDefinition](#) or the [CreateHumanTaskUi](#) API documentation.

#### Amazon Textract

Use the **HumanLoopConfig** parameter of the [AnalyzeDocument](#) API to initiate a human review workflow using Amazon Textract.

## Programmatic Tutorials

The following tutorials provide example code and step-by-step instructions for creating human review workflows and worker task templates programmatically.

- [Tutorial: Get Started Using the Amazon A2I API \(p. 2320\)](#)
- [Create a Human Review Workflow \(API\) \(p. 2341\)](#)
- [Create and Start a Human Loop \(p. 2358\)](#)
- [Using Amazon Augmented AI with Amazon Rekognition in the \*Amazon Rekognition Developer Guide\*](#)
- [Using Amazon Augmented AI with Amazon Textract AnalyzeDocument in the \*Amazon Textract Developer Guide\*](#)

# Buy and Sell Amazon SageMaker Algorithms and Models in Amazon Web Services Marketplace

This feature is not available in the China Regions.

Amazon SageMaker integrates with Amazon Web Services Marketplace, enabling developers to charge other SageMaker users for the use of their algorithms and model packages. Amazon Web Services Marketplace is a curated digital catalog that makes it easy for customers to find, buy, deploy, and manage third-party software and services that customers need to build solutions and run their businesses. Amazon Web Services Marketplace includes thousands of software listings in popular categories, such as security, networking, storage, machine learning, business intelligence, database, and DevOps. It simplifies software licensing and procurement with flexible pricing options and multiple deployment methods.

## Use your own algorithms and models with the Amazon Marketplace

The following sections show how to create algorithm and model package resources that you can use locally and publish to the Amazon Marketplace.

### Topics

- [Create Algorithm and Model Package Resources \(p. 2396\)](#)
- [Use Algorithm and Model Package Resources \(p. 2402\)](#)

## Create Algorithm and Model Package Resources

After your training and/or inference code is packaged in Docker containers, create algorithm and model package resources that you can use in your Amazon SageMaker account and, optionally, publish on Amazon Web Services Marketplace.

### Topics

- [Create an Algorithm Resource \(p. 2396\)](#)
- [Create a Model Package Resource \(p. 2400\)](#)

## Create an Algorithm Resource

To create an algorithm resource that you can use to run training jobs in Amazon SageMaker and publish on Amazon Web Services Marketplace specify the following information:

- The Docker containers that contains the training and, optionally, inference code.
- The configuration of the input data that your algorithm expects for training.
- The hyperparameters that your algorithm supports.

- Metrics that your algorithm sends to Amazon CloudWatch during training jobs.
- The instance types that your algorithm supports for training and inference, and whether it supports distributed training across multiple instances.
- Validation profiles, which are training jobs that SageMaker uses to test your algorithm's training code and batch transform jobs that SageMaker runs to test your algorithm's inference code.

To ensure that buyers and sellers can be confident that products work in SageMaker, we require that you validate your algorithms before listing them on Amazon Web Services Marketplace. You can list products in the Amazon Web Services Marketplace only if validation succeeds. To validate your algorithms, SageMaker uses your validation profile and sample data to run the following validations tasks:

1. Create a training job in your account to verify that your training image works with SageMaker.
2. If you included inference code in your algorithm, create a model in your account using the algorithm's inference image and the model artifacts produced by the training job.
3. If you included inference code in your algorithm, create a transform job in your account using the model to verify that your inference image works with SageMaker.

When you list your product on Amazon Web Services Marketplace, the inputs and outputs of this validation process persist as part of your product and are made available to your buyers. This helps buyers understand and evaluate the product before they buy it. For example, buyers can inspect the input data that you used, the outputs generated, and the logs and metrics emitted by your code. The more comprehensive your validation specification, the easier it is for customers to evaluate your product.

**Note**

In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the **Training jobs** and **Transform jobs** pages. If validation fails, you can access the scan and validation reports from the SageMaker console. If any issues are found, you will have to create the algorithm again.

**Note**

To publish your algorithm on Amazon Web Services Marketplace, at least one validation profile is required.

You can create an algorithm by using either the SageMaker console or the SageMaker API.

**Topics**

- [Create an Algorithm Resource \(Console\) \(p. 2397\)](#)
- [Create an Algorithm Resource \(API\) \(p. 2400\)](#)

## Create an Algorithm Resource (Console)

### To create an algorithm resource (console)

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. Choose **Algorithms**, then choose **Create algorithm**.
3. On the **Training specifications** page, provide the following information:
  - a. For **Algorithm name**, type a name for your algorithm. The algorithm name must be unique in your account and in the Amazon region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
  - b. Type a description for your algorithm. This description appears in the SageMaker console and in the Amazon Web Services Marketplace.

- c. For **Training image**, type the path in Amazon ECR where your training container is stored.
  - d. For **Support distributed training**, Choose Yes if your algorithm supports training on multiple instances. Otherwise, choose No.
  - e. For **Support instance types for training**, choose the instance types that your algorithm supports.
  - f. For **Channel specification**, specify up to 8 channels of input data for your algorithm. For example, you might specify 3 input channels named train, validation, and test. For each channel, specify the following information:
    - i. For **Channel name**, type a name for the channel. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
    - ii. To require the channel for your algorithm, choose **Channel required**.
    - iii. Type a description for the channel.
    - iv. For **Supported input modes**, choose **Pipe mode** if your algorithm supports streaming the input data, and **File mode** if your algorithm supports downloading the input data as a file. You can choose both.
    - v. For **Supported content types**, type the MIME type that your algorithm expects for input data.
    - vi. For **Supported compression type**, choose **Gzip** if your algorithm supports Gzip compression. Otherwise, choose **None**.
    - vii. Choose **Add channel** to add another data input channel, or choose **Next** if you are done adding channels.
4. On the **Tuning specifications** page, provide the following information:

- a. For **Hyperparameter specification**, specify the hyperparameters that your algorithm supports by editing the JSON object. For each hyperparameter that your algorithm supports, construct a JSON block similar to the following:

```
{
  "DefaultValue": "5",
  "Description": "The first hyperparameter",
  "IsRequired": true,
  "IsTunable": false,
  "Name": "intRange",
  "Range": {
    "IntegerParameterRangeSpecification": {
      "MaxValue": "10",
      "MinValue": "1"
    },
    "Type": "Integer"
  }
}
```

In the JSON, supply the following:

- i. For **DefaultValue**, specify a default value for the hyperparameter, if there is one.
- ii. For **Description**, specify a description for the hyperparameter.
- iii. For **IsRequired**, specify whether the hyperparameter is required.
- iv. For **IsTunable**, specify **true** if this hyperparameter can be tuned when a user runs a hyperparameter tuning job that uses this algorithm. For information, see [Perform Automatic Model Tuning with SageMaker \(p. 1745\)](#).
- v. For **Name**, specify a name for the hyperparameter.
- vi. For **Range**, specify one of the following:
  - **IntegerParameterRangeSpecification** - the values of the hyperparameter are integers. Specify minimum and maximum values for the hyperparameter.

- - **ContinuousParameterRangeSpecification** - the values of the hyperparameter are floating-point values. Specify minimum and maximum values for the hyperparameter.
    - **CategoricalParameterRangeSpecification** - the values of the hyperparameter are categorical values. Specify a list of all of the possible values.
- vii. For **Type**, specify **Integer**, **Continuous**, or **Categorical**. The value must correspond to the type of Range that you specified.
- b. For **Metric definitions**, specify any training metrics that you want your algorithm to emit. SageMaker uses the regular expression that you specify to find the metrics by parsing the logs from your training container during training. Users can view these metrics when they run training jobs with your algorithm, and they can monitor and plot the metrics in Amazon CloudWatch. For information, see [Monitor and Analyze Training Jobs Using Metrics \(p. 1868\)](#). For each metric, provide the following information:
- i. For **Metric name**, type a name for the metric.
  - ii. For **Regex**, type the regular expression that SageMaker uses to parse training logs so that it can find the metric value.
  - iii. For **Objective metric support** choose **Yes** if this metric can be used as the objective metric for a hyperparameter tuning job. For information, see [Perform Automatic Model Tuning with SageMaker \(p. 1745\)](#).
  - iv. Choose **Add metric** to add another metric, or choose **Next** if you are done adding metrics.
5. On the **Inference specifications** page, provide the following information if your algorithm supports inference:
- a. For **Container definition**, type path in Amazon ECR where your inference container is stored.
  - b. For **Container DNS host name**, type the name of a DNS host for your image.
  - c. For **Supported instance types for real-time inference**, choose the instance types that your algorithm supports for models deployed as hosted endpoints in SageMaker. For information, see [Deploy a Model on SageMaker Hosting Services \(p. 10\)](#).
  - d. For **Supported instance types for batch transform jobs**, choose the instance types that your algorithm supports for batch transform jobs. For information, see [Get Inferences for an Entire Dataset with Batch Transform \(p. 13\)](#).
  - e. For **Supported content types**, type the type of input data that your algorithm expects for inference requests.
  - f. For **Supported response MIME types**, type the MIME types that your algorithm supports for inference responses.
  - g. Choose **Next**.
6. On the **Validation specifications** page, provide the following information:
- a. For **Publish this algorithm on Amazon Web Services Marketplace**, choose **Yes** to publish the algorithm on Amazon Web Services Marketplace.
  - b. For **Validate this algorithm**, choose **Yes** if you want SageMaker to run training jobs and/or batch transform jobs that you specify to test the training and/or inference code of your algorithm.

#### Note

To publish your algorithm on Amazon Web Services Marketplace, your algorithm must be validated.

- c. For **IAM role**, choose an IAM role that has the required permissions to run training jobs and batch transform jobs in SageMaker, or choose **Create a new role** to allow SageMaker to create a role that has the `AmazonSageMakerFullAccess` managed policy attached. For information, see [SageMaker Roles \(p. 2447\)](#).
- d. For **Validation profile**, specify the following:

- A name for the validation profile.
  - A **Training job definition**. This is a JSON block that describes a training job. This is in the same format as the `TrainingJobDefinition` input parameter of the `CreateAlgorithm` API.
  - A **Transform job definition**. This is a JSON block that describes a batch transform job. This is in the same format as the `TransformJobDefinition` input parameter of the `CreateAlgorithm` API.
- e. Choose **Create algorithm**.

## Create an Algorithm Resource (API)

To create an algorithm resource by using the SageMaker API, call the `CreateAlgorithm` API.

## Create a Model Package Resource

To create a model package resource that you can use to create deployable models in Amazon SageMaker and publish on Amazon Web Services Marketplace specify the following information:

- The Docker container that contains the inference code, or the algorithm resource that was used to train the model.
- The location of the model artifacts. Model artifacts can either be packaged in the same Docker container as the inference code or stored in Amazon S3.
- The instance types that your model package supports for both real-time inference and batch transform jobs.
- Validation profiles, which are batch transform jobs that SageMaker runs to test your model package's inference code.

Before listing model packages on Amazon Web Services Marketplace, you must validate them. This ensures that buyers and sellers can be confident that products work in Amazon SageMaker. You can list products on Amazon Web Services Marketplace only if validation succeeds.

The validation procedure uses your validation profile and sample data to run the following validations tasks:

1. Create a model in your account using the model package's inference image and the optional model artifacts that are stored in Amazon S3.

**Note**

A model package is specific to the region in which you create it. The S3 bucket where the model artifacts are stored must be in the same region where your created the model package.

2. Create a transform job in your account using the model to verify that your inference image works with SageMaker.
3. Create a validation profile.

**Note**

In your validation profile, provide only data that you want to expose publicly.

Validation can take up to a few hours. To see the status of the jobs in your account, in the SageMaker console, see the **Transform jobs** pages. If validation fails, you can access the scan and validation reports from the SageMaker console. After fixing issues, recreate the algorithm. When the status of the algorithm is **COMPLETED**, find it in the SageMaker console and start the listing process

**Note**

To publish your model package on Amazon Web Services Marketplace, at least one validation profile is required.

You can create a model package either by using the SageMaker console or by using the SageMaker API.

### Topics

- [Create a Model Package Resource \(Console\) \(p. 2401\)](#)
- [Create a Model Package Resource \(API\) \(p. 2402\)](#)

## Create a Model Package Resource (Console)

### To create a model package in the SageMaker console:

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. Choose **Model packages**, then choose **Create model package**.
3. On the **Inference specifications** page, provide the following information:
  - a. For **Model package name**, type a name for your model package. The model package name must be unique in your account and in the Amazon region. The name must have 1 to 64 characters. Valid characters are a-z, A-Z, 0-9, and - (hyphen).
  - b. Type a description for your model package. This description appears in the SageMaker console and in the Amazon Web Services Marketplace.
  - c. For **Inference specification options**, choose **Provide the location of the inference image and model artifacts** to create a model package by using an inference container and model artifacts. Choose **Provide the algorithm used for training and its model artifacts** to create a model package from an algorithm resource that you created or subscribe to from Amazon Web Services Marketplace.
  - d. If you chose **Provide the location of the inference image and model artifacts** for **Inference specification options**, provide the following information for **Container definition** and **Supported resources**:
    - i. For **Location of inference image**, type the path to the image that contains your inference code. The image must be stored as a Docker container in Amazon ECR.
    - ii. For **Location of model data artifacts**, type the location in S3 where your model artifacts are stored.
    - iii. For **Container DNS host name**, type the name of the DNS host to use for your container.
    - iv. For **Supported instance types for real-time inference**, choose the instance types that your model package supports for real-time inference from SageMaker hosted endpoints.
    - v. For **Supported instance types for batch transform jobs**, choose the instance types that your model package supports for batch transform jobs.
    - vi. For **Supported content types**, type the content types that your model package expects for inference requests.
    - vii. For **Supported response MIME types**, type the MIME types that your model package uses to provide inferences.
  - e. If you chose **Provide the algorithm used for training and its model artifacts** for **Inference specification options**, provide the following information:
    - i. For **Algorithm ARN**, type the Amazon Resource Name (ARN) of the algorithm resource to use to create the model package.
    - ii. For **Location of model data artifacts**, type the location in S3 where your model artifacts are stored.
  - f. Choose **Next**.
4. On the **Validation and scanning** page, provide the following information:
  - a. For **Publish this model package on Amazon Web Services Marketplace**, choose **Yes** to publish the model package on Amazon Web Services Marketplace.

- b. For **Validate this model package**, choose **Yes** if you want SageMaker to run batch transform jobs that you specify to test the inference code of your model package.

**Note**

To publish your model package on Amazon Web Services Marketplace, your model package must be validated.

- c. For **IAM role**, choose an IAM role that has the required permissions to run batch transform jobs in SageMaker, or choose **Create a new role** to allow SageMaker to create a role that has the `AmazonSageMakerFullAccess` managed policy attached. For information, see [SageMaker Roles \(p. 2447\)](#).
  - d. For **Validation profile**, specify the following:
    - A name for the validation profile.
    - A **Transform job definition**. This is a JSON block that describes a batch transform job. This is in the same format as the `TransformJobDefinition` input parameter of the `CreateAlgorithm` API.
5. Choose **Create model package**.

## Create a Model Package Resource (API)

To create a model package by using the SageMaker API, call the [CreateModelPackage](#) API.

# Use Algorithm and Model Package Resources

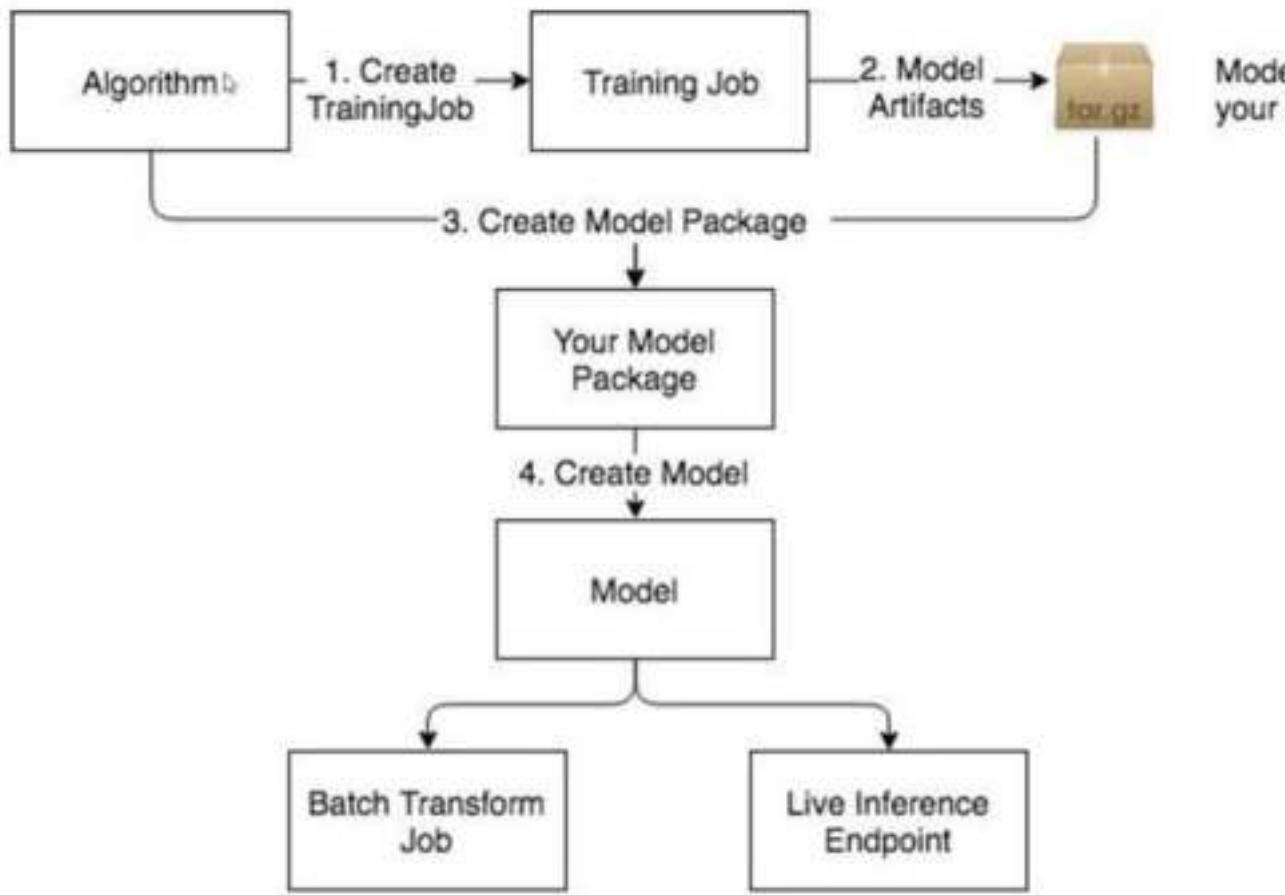

You can create algorithms and model packages as resources in your Amazon SageMaker account, and you can find and subscribe to algorithms and model packages on Amazon Web Services Marketplace.

Use algorithms to:

- Run training jobs. For information, see [Use an Algorithm to Run a Training Job \(p. 2403\)](#).
- Run hyperparameter tuning jobs. For information, see [Use an Algorithm to Run a Hyperparameter Tuning Job \(p. 2405\)](#).
- Create model packages. After you use an algorithm resource to run a training job or a hyperparameter tuning job, you can use the model artifacts that these jobs output along with the algorithm to create a model package. For information, see [Create a Model Package Resource \(p. 2400\)](#).

**Note**

If you subscribe to an algorithm on Amazon Web Services Marketplace, you must create a model package before you can use it to get inferences by creating hosted endpoint or running a batch transform job.

Use model packages to:

- Create models that you can use to get real-time inference or run batch transform jobs. For information, see [Use a Model Package to Create a Model \(p. 2408\)](#).
- Create hosted endpoints to get real-time inference. For information, see [Deploy the Model to SageMaker Hosting Services \(p. 63\)](#).
- Create batch transform jobs. For information, see [\(Optional\) Make Prediction with Batch Transform \(p. 64\)](#).

#### Topics

- [Use an Algorithm to Run a Training Job \(p. 2403\)](#)
- [Use an Algorithm to Run a Hyperparameter Tuning Job \(p. 2405\)](#)
- [Use a Model Package to Create a Model \(p. 2408\)](#)

## Use an Algorithm to Run a Training Job

You can create use an algorithm resource to create a training job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the [Amazon SageMaker Python SDK](#).

#### Topics

- [Use an Algorithm to Run a Training Job \(Console\) \(p. 2404\)](#)
- [Use an Algorithm to Run a Training Job \(API\) \(p. 2405\)](#)

- [Use an Algorithm to Run a Training Job \(Amazon SageMaker Python SDK\) \(p. 2405\)](#)

## Use an Algorithm to Run a Training Job (Console)

### To use an algorithm to run a training job (console)

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. Choose **Algorithms**.
3. Choose an algorithm that you created from the list on the **My algorithms** tab or choose an algorithm that you subscribed to on the **Amazon Web Services Marketplace subscriptions** tab.
4. Choose **Create training job**.

The algorithm you chose will automatically be selected.

5. On the **Create training job** page, provide the following information:
  - a. For **Job name**, type a name for the training job.
  - b. For **IAM role**, choose an IAM role that has the required permissions to run training jobs in SageMaker, or choose **Create a new role** to allow SageMaker to create a role that has the `AmazonSageMakerFullAccess` managed policy attached. For information, see [SageMaker Roles \(p. 2447\)](#).
  - c. For **Resource configuration**, provide the following information:
    - i. For **Instance type**, choose the instance type to use for training.
    - ii. For **Instance count**, type the number of ML instances to use for the training job.
    - iii. For **Additional volume per instance (GB)**, type the size of the ML storage volume that you want to provision. ML storage volumes store model artifacts and incremental states.
    - iv. For **Encryption key**, if you want Amazon SageMaker to use an Amazon Key Management Service key to encrypt data in the ML storage volume attached to the training instance, specify the key.
    - v. For **Stopping condition**, specify the maximum amount of time in seconds, minutes, hours, or days, that you want the training job to run.
  - d. For **VPC**, choose a Amazon VPC that you want to allow your training container to access. For more information, see [Give SageMaker Training Jobs Access to Resources in Your Amazon VPC \(p. 2513\)](#).
  - e. For **Hyperparameters**, specify the values of the hyperparameters to use for the training job.
  - f. For **Input data configuration**, specify the following values for each channel of input data to use for the training job. You can see what channels the algorithm you're using for training supports, and the content type, supported compression type, and supported input modes for each channel, under **Channel specification** section of the **Algorithm summary** page for the algorithm.
    - i. For **Channel name**, type the name of the input channel.
    - ii. For **Content type**, type the content type of the data that the algorithm expects for the channel.
    - iii. For **Compression type**, choose the data compression type to use, if any.
    - iv. For **Record wrapper**, choose RecordIO if the algorithm expects data in the RecordIO format.
    - v. For **S3 data type**, **S3 data distribution type**, and **S3 location**, specify the appropriate values. For information about what these values mean, see [S3DataSource](#).
    - vi. For **Input mode**, choose **File** to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose **Pipe** to stream data directly from Amazon S3 to the container.

- vii. To add another input channel, choose **Add channel**. If you are finished adding input channels, choose **Done**.
- g. For **Output** location, specify the following values:
  - i. For **S3 output path**, choose the S3 location where the training job stores output, such as model artifacts.

**Note**  
You use the model artifacts stored at this location to create a model or model package from this training job.
  - ii. For **Encryption key**, if you want SageMaker to use a Amazon KMS key to encrypt output data at rest in the S3 location.
- h. For **Tags**, specify one or more tags to manage the training job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
- i. Choose **Create training job** to run the training job.

## Use an Algorithm to Run a Training Job (API)

To use an algorithm to run a training job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) as the `AlgorithmName` field of the `AlgorithmSpecification` object that you pass to `CreateTrainingJob`. For information about training models in SageMaker, see [Train a Model with Amazon SageMaker \(p. 8\)](#).

## Use an Algorithm to Run a Training Job (Amazon SageMaker Python SDK)

Use an algorithm that you created or subscribed to on Amazon Web Services Marketplace to create a training job, create an `AlgorithmEstimator` object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the `algorithm_arn` argument. Then call the `fit` method of the estimator. For example:

```
from sagemaker import AlgorithmEstimator
data_path = os.path.join(DATA_DIR, 'marketplace', 'training')

algo = AlgorithmEstimator(
    algorithm_arn='arn:aws:sagemaker:us-east-2:012345678901:algorithm/my-algorithm',
    role='SageMakerRole',
    instance_count=1,
    instance_type='ml.c4.xlarge',
    sagemaker_session=sagemaker_session,
    base_job_name='test-marketplace')

train_input = algo.sagemaker_session.upload_data(
    path=data_path, key_prefix='integ-test-data/marketplace/train')

algo.fit({'training': train_input})
```

## Use an Algorithm to Run a Hyperparameter Tuning Job

A hyperparameter tuning job finds the best version of a model by running many training jobs on your dataset using the algorithm and ranges of hyperparameters that you specify. It then chooses the hyperparameter values that result in a model that performs the best, as measured by a metric that you choose. For more information, see [Perform Automatic Model Tuning with SageMaker \(p. 1745\)](#).

You can create use an algorithm resource to create a hyperparameter tuning job by using the Amazon SageMaker console, the low-level Amazon SageMaker API, or the [Amazon SageMaker Python SDK](#).

### Topics

- [Use an Algorithm to Run a Hyperparameter Tuning Job \(Console\) \(p. 2406\)](#)
- [Use an Algorithm to Run a Hyperparameter Tuning Job \(API\) \(p. 2407\)](#)
- [Use an Algorithm to Run a Hyperparameter Tuning Job \(Amazon SageMaker Python SDK\) \(p. 2408\)](#)

## Use an Algorithm to Run a Hyperparameter Tuning Job (Console)

### To use an algorithm to run a hyperparameter tuning job (console)

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
  2. Choose **Algorithms**.
  3. Choose an algorithm that you created from the list on the **My algorithms** tab or choose an algorithm that you subscribed to on the **Amazon Web Services Marketplace subscriptions** tab.
  4. Choose **Create hyperparameter tuning job**.
- The algorithm you chose will automatically be selected.
5. On the **Create hyperparameter tuning job** page, provide the following information:
    - a. For **Warm start**, choose **Enable warm start** to use the information from previous hyperparameter tuning jobs as a starting point for this hyperparameter tuning job. For more information, see [Run a Warm Start Hyperparameter Tuning Job \(p. 1765\)](#).
      - i. Choose **Identical data and algorithm** if your input data is the same as the input data for the parent jobs of this hyperparameter tuning job, or choose **Transfer learning** to use additional or different input data for this hyperparameter tuning job.
      - ii. For **Parent hyperparameter tuning job(s)**, choose up to 5 hyperparameter tuning jobs to use as parents to this hyperparameter tuning job.
    - b. For **Hyperparameter tuning job name**, type a name for the tuning job.
    - c. For **IAM role**, choose an IAM role that has the required permissions to run hyperparameter tuning jobs in SageMaker, or choose **Create a new role** to allow SageMaker to create a role that has the `AmazonSageMakerFullAccess` managed policy attached. For information, see [SageMaker Roles \(p. 2447\)](#).
    - d. For **VPC**, choose a Amazon VPC that you want to allow the training jobs that the tuning job launches to access. For more information, see [Give SageMaker Training Jobs Access to Resources in Your Amazon VPC \(p. 2513\)](#).
    - e. Choose **Next**.
    - f. For **Objective metric**, choose the metric that the hyperparameter tuning job uses to determine the best combination of hyperparameters, and choose whether to minimize or maximize this metric. For more information, see [View the Best Training Job \(p. 1763\)](#).
    - g. For **Hyperparameter configuration**, choose ranges for the tunable hyperparameters that you want the tuning job to search, and set static values for hyperparameters that you want to remain constant in all training jobs that the hyperparameter tuning job launches. For more information, see [Define Hyperparameter Ranges \(p. 1748\)](#).
    - h. Choose **Next**.
    - i. For **Input data configuration**, specify the following values for each channel of input data to use for the hyperparameter tuning job. You can see what channels the algorithm you're using for hyperparameter tuning supports, and the content type, supported compression type, and supported input modes for each channel, under **Channel specification** section of the **Algorithm summary** page for the algorithm.
      - i. For **Channel name**, type the name of the input channel.
      - ii. For **Content type**, type the content type of the data that the algorithm expects for the channel.
      - iii. For **Compression type**, choose the data compression type to use, if any.

- iv. For **Record wrapper**, choose RecordIO if the algorithm expects data in the RecordIO format.
  - v. For **S3 data type**, **S3 data distribution type**, and **S3 location**, specify the appropriate values. For information about what these values mean, see [S3DataSource](#).
  - vi. For **Input mode**, choose **File** to download the data from to the provisioned ML storage volume, and mount the directory to a Docker volume. Choose **Pipe** to stream data directly from Amazon S3 to the container.
  - vii. To add another input channel, choose **Add channel**. If you are finished adding input channels, choose **Done**.
- j. For **Output** location, specify the following values:
- i. For **S3 output path**, choose the S3 location where the training jobs that this hyperparameter tuning job launches store output, such as model artifacts.
- Note**  
You use the model artifacts stored at this location to create a model or model package from this hyperparameter tuning job.
- ii. For **Encryption key**, if you want SageMaker to use a Amazon KMS key to encrypt output data at rest in the S3 location.
- k. For **Resource configuration**, provide the following information:
- i. For **Instance type**, choose the instance type to use for each training job that the hyperparameter tuning job launches.
  - ii. For **Instance count**, type the number of ML instances to use for each training job that the hyperparameter tuning job launches.
  - iii. For **Additional volume per instance (GB)**, type the size of the ML storage volume that you want to provision each training job that the hyperparameter tuning job launches. ML storage volumes store model artifacts and incremental states.
  - iv. For **Encryption key**, if you want Amazon SageMaker to use an Amazon Key Management Service key to encrypt data in the ML storage volume attached to the training instances, specify the key.
- l. For **Resource limits**, provide the following information:
- i. For **Maximum training jobs**, specify the maximum number of training jobs that you want the hyperparameter tuning job to launch. A hyperparameter tuning job can launch a maximum of 500 training jobs.
  - ii. For **Maximum parallel training jobs**, specify the maximum number of concurrent training jobs that the hyperparameter tuning job can launch. A hyperparameter tuning job can launch a maximum of 10 concurrent training jobs.
  - iii. For **Stopping condition**, specify the maximum amount of time in seconds, minutes, hours, or days, that you want each training job that the hyperparameter tuning job launches to run.
  - m. For **Tags**, specify one or more tags to manage the hyperparameter tuning job. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
  - n. Choose **Create jobs** to run the hyperparameter tuning job.

## Use an Algorithm to Run a Hyperparameter Tuning Job (API)

To use an algorithm to run a hyperparameter tuning job by using the SageMaker API, specify either the name or the Amazon Resource Name (ARN) of the algorithm as the `AlgorithmName` field of the `AlgorithmSpecification` object that you pass to [CreateHyperParameterTuningJob](#). For information about hyperparameter tuning in SageMaker, see [Perform Automatic Model Tuning with SageMaker \(p. 1745\)](#).

## Use an Algorithm to Run a Hyperparameter Tuning Job (Amazon SageMaker Python SDK)

Use an algorithm that you created or subscribed to on Amazon Web Services Marketplace to create a hyperparameter tuning job, create an `AlgorithmEstimator` object and specify either the Amazon Resource Name (ARN) or the name of the algorithm as the value of the `algorithm_arn` argument. Then initialize a `HyperparameterTuner` object with the `AlgorithmEstimator` you created as the value of the `estimator` argument. Finally, call the `fit` method of the `AlgorithmEstimator`. For example:

```
from sagemaker import AlgorithmEstimator
from sagemaker.tuner import HyperparameterTuner

data_path = os.path.join(DATA_DIR, 'marketplace', 'training')

algo = AlgorithmEstimator(
    algorithm_arn='arn:aws:sagemaker:us-east-2:764419575721:algorithm/scikit-decision-trees-1542410022',
    role='SageMakerRole',
    instance_count=1,
    instance_type='ml.c4.xlarge',
    sagemaker_session=sagemaker_session,
    base_job_name='test-marketplace')

train_input = algo.sagemaker_session.upload_data(
    path=data_path, key_prefix='integ-test-data/marketplace/train')

algo.set_hyperparameters(max_leaf_nodes=10)
tuner = HyperparameterTuner(estimator=algo, base_tuning_job_name='some-name',
                             objective_metric_name='validation:accuracy',
                             hyperparameter_ranges=hyperparameter_ranges,
                             max_jobs=2, max_parallel_jobs=2)

tuner.fit({'training': train_input}, include_cls_metadata=False)
tuner.wait()
```

## Use a Model Package to Create a Model

Use a model package to create a deployable model that you can use to get real-time inferences by creating a hosted endpoint or to run batch transform jobs. You can create a deployable model from a model package by using the Amazon SageMaker console, the low-level SageMaker API, or the [Amazon SageMaker Python SDK](#).

### Topics

- [Use a Model Package to Create a Model \(Console\) \(p. 2408\)](#)
- [Use a Model Package to Create a Model \(API\) \(p. 2409\)](#)
- [Use a Model Package to Create a Model \(Amazon SageMaker Python SDK\) \(p. 2409\)](#)

## Use a Model Package to Create a Model (Console)

### To create a deployable model from a model package (console)

1. Open the SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. Choose **Model packages**.
3. Choose a model package that you created from the list on the **My model packages** tab or choose a model package that you subscribed to on the **Amazon Web Services Marketplace subscriptions** tab.
4. Choose **Create model**.

5. For **Model name**, type a name for the model.
6. For **IAM role**, choose an IAM role that has the required permissions to call other services on your behalf, or choose **Create a new role** to allow SageMaker to create a role that has the `AmazonSageMakerFullAccess` managed policy attached. For information, see [SageMaker Roles \(p. 244\)](#).
7. For **VPC**, choose a Amazon VPC that you want to allow the model to access. For more information, see [Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC \(p. 2510\)](#).
8. Leave the default values for **Container input options** and **Choose model package**.
9. For environment variables, provide the names and values of environment variables you want to pass to the model container.
10. For **Tags**, specify one or more tags to manage the model. Each tag consists of a key and an optional value. Tag keys must be unique per resource.
11. Choose **Create model**.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see [Deploy Models for Inference](#).

## Use a Model Package to Create a Model (API)

To use a model package to create a deployable model by using the SageMaker API, specify the name or the Amazon Resource Name (ARN) of the model package as the `ModelPackageName` field of the `ContainerDefinition` object that you pass to the `CreateModel` API.

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosted endpoints in SageMaker, see [Deploy Models for Inference](#).

## Use a Model Package to Create a Model (Amazon SageMaker Python SDK)

To use a model package to create a deployable model by using the SageMaker Python SDK, initialize a `ModelPackage` object, and pass the Amazon Resource Name (ARN) of the model package as the `model_package_arn` argument. For example:

```
from sagemaker import ModelPackage
model = ModelPackage(role='SageMakerRole',
                      model_package_arn='training-job-scikit-decision-trees-1542660466-6f92',
                      sagemaker_session=sagemaker_session)
```

After you create a deployable model, you can use it to set up an endpoint for real-time inference or create a batch transform job to get inferences on entire datasets. For information about hosting endpoints in SageMaker, see [Deploy Models for Inference](#).

# Security in Amazon SageMaker

Cloud security at Amazon is the highest priority. As an Amazon customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between Amazon and you. The [shared responsibility model](#) describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – Amazon is responsible for protecting the infrastructure that runs Amazon services in the Amazon Cloud. Amazon also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [Amazon compliance programs](#). To learn about the compliance programs that apply to Amazon SageMaker, see [Amazon Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility is determined by the Amazon service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using SageMaker. The following topics show you how to configure SageMaker to meet your security and compliance objectives. You also learn how to use other Amazon services that help you to monitor and secure your SageMaker resources.

## Topics

- [Access Control \(p. 2410\)](#)
- [Data Protection in Amazon SageMaker \(p. 2412\)](#)
- [Identity and Access Management for Amazon SageMaker \(p. 2417\)](#)
- [Logging and Monitoring \(p. 2489\)](#)
- [Compliance Validation for Amazon SageMaker \(p. 2490\)](#)
- [Resilience in Amazon SageMaker \(p. 2490\)](#)
- [Infrastructure Security in Amazon SageMaker \(p. 2491\)](#)

## Access Control

Amazon SageMaker Studio notebooks and SageMaker notebook instances differ in their runtime environments. The following topics describe how to control root access to these notebooks.

## Topics

- [Access control and SageMaker Studio notebooks \(p. 2410\)](#)
- [Control root access to a SageMaker notebook instance \(p. 2412\)](#)

## Access control and SageMaker Studio notebooks

Amazon SageMaker Studio uses filesystem and container permissions for access control and isolation of Studio users and notebooks. This is one of the major differences between Studio notebooks and SageMaker notebook instances. This topic describes how permissions are set up to avoid security threats,

what SageMaker does by default, and how the customer can customize the permissions. For more information about Studio notebooks and their runtime environment, see [Use Amazon SageMaker Studio Notebooks \(p. 76\)](#).

### SageMaker app permissions

A *run-as user* is a POSIX user/group which is used to run the JupyterServer app and KernelGateway apps inside the container.

The run-as user for the JupyterServer app is sagemaker-user (1000) by default. This user has sudo permissions to enable the installation of dependencies such as yum packages.

The run-as user for the KernelGateway apps is root (0) by default. This user is able to install dependencies using pip/apt-get/conda.

Due to the previously mentioned user remapping, neither user is able to access resources or make changes to the host instance.

### User remapping

SageMaker performs user-remapping to map a user inside the container to a user on the host instance outside the container. The range of user IDs (0 - 65535) in the container are mapped to non-privileged user IDs above 65535 on the instance. For example, sagemaker-user (1000) inside the container might map to user (200001) on the instance, where the number in parentheses is the user ID. If the customer creates a new user/group inside the container, it won't be privileged on the host instance regardless of the user/group ID. The root user of the container is also mapped to a non-privileged user on the instance. For more information, see [Isolate containers with a user namespace](#).

### Custom image permissions

Customers can bring their own custom SageMaker images. These images can specify a different run-as user/group to launch the KernelGateway app. The customer can implement fine grained permission control inside the image, for example, to disable root access or perform other actions. The same user remapping applies here. For more information, see [Bring your own SageMaker image \(p. 95\)](#).

### Container isolation

Docker keeps a list of default capabilities that the container can use. SageMaker doesn't add additional capabilities. SageMaker adds specific route rules to block requests to Amazon EFS and the [instance metadata service](#) (IMDS) from the container. Customers can't change these route rules from the container. For more information, see [Runtime privilege and Linux capabilities](#).

### App metadata access

Metadata used by running apps are mounted to the container with read-only permission. Customers aren't able to modify this metadata from the container. For the available metadata, see [Get Notebook and App Metadata \(p. 84\)](#).

### User isolation on EFS

When you onboard to Studio, SageMaker creates an Amazon Elastic File System (EFS) volume for your domain that is shared by all Studio users in the domain. Each user gets their own private home directory on the EFS volume. This home directory is used to store the user's notebooks, Git repositories, and other data. To prevent other users in the domain from accessing the user's data, SageMaker creates a globally unique user ID for the user's profile and applies it as a POSIX user/group ID for the user's home directory.

### EBS access

An Amazon Elastic Block Store (Amazon EBS) volume is attached to the host instance and shared across all images. It's used for the root volume of the notebooks and stores temporary data that's generated

inside the container. The storage isn't persisted when the instance running the notebooks is deleted. The root user inside the container can't access the EBS volume.

#### IMDS access

Due to security concerns, access to the Amazon Elastic Compute Cloud (Amazon EC2) Instance Metadata Service (IMDS) is unavailable in SageMaker Studio. For more information on IMDS, see [Instance metadata and user data](#).

## Control root access to a SageMaker notebook instance

By default, when you create a notebook instance, users that log into that notebook instance have root access. Data science is an iterative process that might require the data scientist to test and use different software tools and packages, so many notebook instance users need to have root access to be able to install these tools and packages. Because users with root access have administrator privileges, users can access and edit all files on a notebook instance with root access enabled.

If you don't want users to have root access to a notebook instance, when you call [CreateNotebookInstance](#) or [UpdateNotebookInstance](#) operations, set the `RootAccess` field to `Disabled`. You can also disable root access for users when you create or update a notebook instance in the Amazon SageMaker console. For information, see [Step 1: Create an Amazon SageMaker Notebook Instance \(p. 53\)](#).

#### Note

Lifecycle configurations need root access to be able to set up a notebook instance. Because of this, lifecycle configurations associated with a notebook instance always run with root access even if you disable root access for users.

#### Note

For security reasons, Rootless Docker is installed on root-disabled notebook instances instead of regular Docker. For more information, see [Run the Docker daemon as a non-root user \(Rootless mode\)](#)

## Data Protection in Amazon SageMaker

The Amazon [shared responsibility model](#) applies to data protection in Amazon SageMaker. As described in this model, Amazon is responsible for protecting the global infrastructure that runs all of the Amazon Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the Amazon services that you use. For more information about data privacy, see the [Data Privacy FAQ](#).

For data protection purposes, we recommend that you protect Amazon account credentials and set up individual user accounts with Amazon Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with Amazon resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with Amazon CloudTrail.
- Use Amazon encryption solutions, along with all default security controls within Amazon services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.

- If you require FIPS 140-2 validated cryptographic modules when accessing Amazon through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put sensitive identifying information, such as your customers' account numbers, into free-form fields such as a **Name** field. This includes when you work with Amazon SageMaker or other Amazon services using the console, API, Amazon CLI, or Amazon SDKs. Any data that you enter into Amazon SageMaker or other services might get picked up for inclusion in diagnostic logs. When you provide a URL to an external server, don't include credentials information in the URL to validate your request to that server.

#### Topics

- [Protect Data at Rest Using Encryption \(p. 2413\)](#)
- [Protecting Data in Transit with Encryption \(p. 2414\)](#)
- [Key Management \(p. 2416\)](#)
- [Internetwork Traffic Privacy \(p. 2417\)](#)

## Protect Data at Rest Using Encryption

To protect your Amazon SageMaker Studio notebooks and SageMaker notebook instances, along with your model-building data and model artifacts, SageMaker uses the Amazon Key Management Service (Amazon KMS) to encrypt the notebooks and data. SageMaker uses Amazon managed customer master keys (CMKs) by default. For more control, you can specify your own customer managed CMKs. For more information on Amazon KMS, see [What is Amazon Key Management Service?](#).

#### Topics

- [Studio notebooks \(p. 2413\)](#)
- [Notebook instances and SageMaker jobs \(p. 2414\)](#)

## Studio notebooks

In Amazon SageMaker Studio, your SageMaker Studio notebooks and data can be stored in the following locations:

- An S3 bucket – When you onboard to Studio and enable shareable notebook resources, SageMaker shares notebook snapshots and metadata in an Amazon Simple Storage Service (Amazon S3) bucket.
- An EFS volume – When you onboard to Studio, SageMaker attaches an Amazon Elastic File System (Amazon EFS) volume to your domain for storing your Studio notebooks and data files. The EFS volume persists after the domain is deleted.
- An EBS volume – When you open a notebook in Studio, an Amazon Elastic Block Store (Amazon EBS) is attached to the instance that the notebook runs on. The EBS volume persists for the duration of the instance.

SageMaker uses the Amazon Key Management Service (Amazon KMS) to encrypt the S3 bucket and both volumes with an Amazon managed customer master key (CMK) by default. For more control, you can specify your own customer managed CMK when you onboard to Studio or through the SageMaker API. For more information, see [Onboard to Amazon SageMaker Studio \(p. 35\)](#) and [CreateDomain](#).

In the `CreateDomain` API, you use the `S3KmsKeyId` parameter to specify the custom CMK for shareable notebooks. You use the `KmsKeyId` parameter to specify the custom CMK for the EFS and EBS volumes. The same CMK is used for both volumes. The custom CMK for shareable notebooks can be the same CMK as used for the volumes or a different CMK.

## Notebook instances and SageMaker jobs

To encrypt the machine learning (ML) storage volume that is attached to notebooks, processing jobs, training jobs, hyperparameter tuning jobs, batch transform jobs, and endpoints, you can pass a Amazon KMS key to SageMaker. If you don't specify a KMS key, SageMaker encrypts storage volumes with a transient key and discards it immediately after encrypting the storage volume. For notebook instances, if you don't specify a KMS key, SageMaker encrypts both OS volumes and ML data volumes with a system-managed KMS key.

You can use an Amazon managed KMS key to encrypt all instance OS volumes. You can encrypt all ML data volumes for all SageMaker instances with a KMS key that you specify. ML storage volumes are mounted as follows:

- Notebooks - /home/ec2-user/SageMaker
- Processing - /opt/ml/processing and /tmp/
- Training - /opt/ml/ and /tmp/
- Batch - /opt/ml/ and /tmp/
- Endpoints - /opt/ml/ and /tmp/

Processing, batch transform, and training job containers and their storage are ephemeral in nature. When the job completes, output is uploaded to Amazon S3 using Amazon KMS encryption (with an optional KMS key you specify) and the instance is torn down.

### Important

Sensitive data that needs to be encrypted with a KMS key for compliance reasons should be stored in the ML storage volume or in Amazon S3, both of which can be encrypted using a KMS key you specify.

When you open a notebook instance, SageMaker saves it and any files associated with it in the SageMaker folder in the ML storage volume by default. When you stop a notebook instance, SageMaker creates a snapshot of the ML storage volume. Any customizations to the operating system of the stopped instance, such as installed custom libraries or operating system level settings, are lost. Consider using a lifecycle configuration to automate customizations of the default notebook instance. When you terminate an instance, the snapshot and the ML storage volume are deleted. Any data that you need to persist beyond the lifespan of the notebook instance should be transferred to an Amazon S3 bucket.

### Note

Certain Nitro-based SageMaker instances include local storage, depending on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't use a KMS key on an instance type with local storage. For a list of instance types that support local instance storage, see [Instance Store Volumes](#). For more information about storage volumes on Nitro-based instances, see [Amazon EBS and NVMe on Linux Instances](#).

For more information about local instance storage encryption, see [SSD Instance Store Volumes](#).

## Protecting Data in Transit with Encryption

All inter-network data in transit supports TLS 1.2 encryption.

Amazon SageMaker ensures that machine learning (ML) model artifacts and other system artifacts are encrypted in transit and at rest. Requests to the SageMaker API and console are made over a secure (SSL) connection. You pass Amazon Identity and Access Management roles to SageMaker to provide permissions to access resources on your behalf for training and deployment. You can use encrypted Amazon S3 buckets for model artifacts and data, as well as pass a Amazon KMS key to SageMaker instances to encrypt the attached ML storage volumes.

Some intra-network data in-transit (inside the service platform) is unencrypted. This includes:

- Command and control communications between the service control plane and training job instances (not customer data).
- Communications between nodes in distributed processing jobs (intra-network).
- Communications between nodes in distributed training jobs (intra-network).

There are no inter-node communications for batch processing.

You can choose to encrypt communication between nodes in a training cluster. For information about how to do this, see [Protect Communications Between ML Compute Instances in a Distributed Training Job \(p. 2415\)](#). Enabling inter-container traffic encryption can increase training time, especially if you are using distributed deep learning algorithms. For affected algorithms, adding this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

FIPS validated endpoints are available for the SageMaker API and request router for hosted models (runtime). For information about FIPS compliant endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

## Protect Communications Between ML Compute Instances in a Distributed Training Job

By default, Amazon SageMaker runs training jobs in an Amazon Virtual Private Cloud (Amazon VPC) to help keep your data secure. You can add another level of security to protect your training containers and data by configuring a *private* VPC. Distributed ML frameworks and algorithms usually transmit information that is directly related to the model such as weights, not the training dataset. When performing distributed training, you can further protect data that is transmitted between instances. This can help you to comply with regulatory requirements. To do this, use inter-container traffic encryption.

Enabling inter-container traffic encryption can increase training time, especially if you are using distributed deep learning algorithms. Enabling inter-container traffic encryption doesn't affect training jobs with a single compute instance. However, for training jobs with several compute instances, the effect on training time depends on the amount of communication between compute instances. For affected algorithms, adding this additional level of security also increases cost. The training time for most SageMaker built-in algorithms, such as XGBoost, DeepAR, and linear learner, typically aren't affected.

You can enable inter-container traffic encryption for training jobs or hyperparameter tuning jobs. You can use SageMaker APIs or console to enable inter-container traffic encryption.

For information about running training jobs in a private VPC, see [Give SageMaker Training Jobs Access to Resources in Your Amazon VPC \(p. 2513\)](#).

### Enable Inter-Container Traffic Encryption (API)

Before enabling inter-container traffic encryption on training or hyperparameter tuning jobs with APIs, you need to add inbound and outbound rules to your private VPC's security group.

#### To enable inter-container traffic encryption (API)

1. Add the following inbound and outbound rules in the security group for your private VPC:

Protocol	Port Range	Source
UDP	500	<i>Self Security Group ID</i>
ESP 50	N/A	<i>Self Security Group ID</i>

2. When you send a request to the [CreateTrainingJob](#) or [CreateHyperParameterTuningJob](#) API, specify `True` for the `EnableInterContainerTrafficEncryption` parameter.

**Note**

For the `ESP 50` protocol, the Amazon Security Group Console might display the port range as "All". However, Amazon EC2 ignores the specified port range because it is not applicable for the `ESP 50` IP protocol.

## Enable Inter-Container Traffic Encryption (Console)

### Enable Inter-container Traffic Encryption in a Training Job

#### To enable inter-container traffic encryption in a training job

1. Open the Amazon SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. In the navigation pane, choose **Training**, then choose **Training jobs**.
3. Choose **Create training job**.
4. Under **Network**, choose a **VPC**. You can use the default VPC or one that you have created.
5. Choose **Enable inter-container traffic encryption**.

After you enable inter-container traffic encryption, finish creating the training job. For more information, see [Step 4: Train a Model \(p. 59\)](#).

### Enable Inter-container Traffic Encryption in a Hyperparameter Tuning Job

#### To enable inter-container traffic encryption in a hyperparameter tuning job

1. Open the Amazon SageMaker console at <https://console.amazonaws.cn/sagemaker/>.
2. In the navigation pane, choose **Training**, then choose **Hyperparameter tuning jobs**.
3. Choose **Create hyperparameter tuning job**.
4. Under **Network**, choose a **VPC**. You can use the default VPC or one that you created.
5. Choose **Enable inter-container traffic encryption**.

After enabling inter-container traffic encryption, finish creating the hyperparameter tuning job. For more information, see [Configure and Launch a Hyperparameter Tuning Job \(p. 1757\)](#).

## Key Management

Customers can specify Amazon KMS keys, including bring your own keys (BYOK), to use for envelope encryption with Amazon S3 input/output buckets and machine learning (ML) Amazon EBS volumes. ML volumes for notebook instances and for processing, training, and hosted model Docker containers can be optionally encrypted by using Amazon KMS customer-owned keys. All instance OS volumes are encrypted with an Amazon-managed Amazon KMS key.

**Note**

Certain Nitro-based instances include local storage, dependent on the instance type. Local storage volumes are encrypted using a hardware module on the instance. You can't request a `VolumeKmsKeyId` when using an instance type with local storage.

For a list of instance types that support local instance storage, see [Instance Store Volumes](#).

For more information about local instance storage encryption, see [SSD Instance Store Volumes](#).

For more information about storage volumes on nitro-based instances, see [Amazon EBS and NVMe on Linux Instances](#).

For information about Amazon KMS keys see [What is Amazon Key Management Service?](#) in the *Amazon Key Management Service Developer Guide*.

## Internetwork Traffic Privacy

This topic describes how Amazon SageMaker secures connections from the service to other locations.

Internetwork communications support TLS 1.2 encryption between all components and clients.

Instances can be connected to Customer VPC, providing access to S3 VPC endpoints or customer repositories. Internet egress can be managed through this interface by the customer if service platform internet egress is disabled for notebooks. For training and hosting, egress through the service platform is not available when connected to the customer's VPC.

By default, API calls made to published endpoints traverse the public network to the request router. SageMaker supports Amazon Virtual Private Cloud interface endpoints powered by Amazon PrivateLink for private connectivity between the customer's VPC and the request router to access hosted model endpoints. For information about Amazon VPC, see [Connect to SageMaker Through a VPC Interface Endpoint \(p. 2495\)](#)

## Identity and Access Management for Amazon SageMaker

Amazon Identity and Access Management (IAM) is an Amazon service that helps an administrator securely control access to Amazon resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use SageMaker resources. IAM is an Amazon service that you can use with no additional charge.

### Topics

- [Audience \(p. 2417\)](#)
- [Authenticating with Identities \(p. 2418\)](#)

- [Troubleshooting Amazon SageMaker Identity and Access \(p. 2487\)](#)

## Audience

How you use Amazon Identity and Access Management (IAM) differs, depending on the work that you do in SageMaker.

**Service user** – If you use the SageMaker service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more SageMaker features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in SageMaker, see [Troubleshooting Amazon SageMaker Identity and Access \(p. 2487\)](#).

**Service administrator** – If you're in charge of SageMaker resources at your company, you probably have full access to SageMaker. It's your job to determine which SageMaker features and resources your employees should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with SageMaker, see [How Amazon SageMaker Works with IAM \(p. 2421\)](#).

**IAM administrator** – If you're an IAM administrator, you might want to learn details about how you can write policies to manage access to SageMaker. To view example SageMaker identity-based policies that you can use in IAM, see [Amazon SageMaker Identity-Based Policy Examples \(p. 2424\)](#).

## Authenticating with Identities

Authentication is how you sign in to Amazon using your identity credentials. For more information about signing in using the Amazon Web Services Management Console, see [Signing in to the Amazon Web Services Management Console as an IAM user or root user](#) in the *IAM User Guide*.

You must be *authenticated* (signed in to Amazon) as the Amazon account root user, an IAM user, or by assuming an IAM role. You can also use your company's single sign-on authentication or even sign in using Google or Facebook. In these cases, your administrator previously set up identity federation using IAM roles. When you access Amazon using credentials from another company, you are assuming a role indirectly.

To sign in directly to the [Amazon Web Services Management Console](#), use your password with your root user email address or your IAM user name. You can access Amazon programmatically using your root user or IAM users access keys. Amazon provides SDK and command line tools to cryptographically sign your request using your credentials. If you don't use Amazon tools, you must sign the request yourself. Do this using *Signature Version 4*, a protocol for authenticating inbound API requests. For more information about authenticating requests, see [Signature Version 4 signing process](#) in the *Amazon General Reference*.

Regardless of the authentication method that you use, you might also be required to provide additional security information. For example, Amazon recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see [Using multi-factor authentication \(MFA\) in Amazon](#) in the *IAM User Guide*.

### Amazon account root user

When you first create an Amazon account, you begin with a single sign-in identity that has complete access to all Amazon services and resources in the account. This identity is called the Amazon account *root user* and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks, even the administrative ones. Instead, adhere to the [best practice of using the root user only to create your first IAM user](#). Then securely lock away the root user credentials and use them to perform only a few account and service management tasks.

### IAM Users and Groups

An *IAM user* is an identity within your Amazon account that has specific permissions for a single person or application. An IAM user can have long-term credentials such as a user name and password or a set of access keys. To learn how to generate access keys, see [Managing access keys for IAM users](#) in the *IAM User Guide*. When you generate access keys for an IAM user, make sure you view and securely save the key pair. You cannot recover the secret access key in the future. Instead, you must generate a new access key pair.

An *IAM group* is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to

manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see [When to create an IAM user \(instead of a role\)](#) in the *IAM User Guide*.

## IAM Roles

An *IAM role* is an identity within your Amazon account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the Amazon Web Services Management Console by [switching roles](#). You can assume a role by calling an Amazon CLI or Amazon API operation or by using a custom URL. For more information about methods for using roles, see [Using IAM roles](#) in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Temporary IAM user permissions** – An IAM user can assume an IAM role to temporarily take on different permissions for a specific task.
- **Federated user access** – Instead of creating an IAM user, you can use existing identities from Amazon Directory Service, your enterprise user directory, or a web identity provider. These are known as *federated users*. Amazon assigns a role to a federated user when access is requested through an [identity provider](#). For more information about federated users, see [Federated users and roles](#) in the *IAM User Guide*.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some Amazon services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see [How IAM roles differ from resource-based policies](#) in the *IAM User Guide*.
- **Cross-service access** – Some Amazon services use features in other Amazon services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
  - **Principal permissions** – When you use an IAM user or role to perform actions in Amazon, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see [Actions, Resources, and Condition Keys for Amazon SageMaker](#) in the *Service Authorization Reference*.
  - **Service role** – A service role is an *IAM role* that a service assumes to perform actions on your behalf. Service roles provide access only within your account and cannot be used to grant access to services in other accounts. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see [Creating a role to delegate permissions to an Amazon service](#) in the *IAM User Guide*.
  - **Service-linked role** – A service-linked role is a type of service role that is linked to an Amazon service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.
- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making Amazon CLI or Amazon API requests. This is preferable to storing access keys within the EC2 instance. To assign an Amazon role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see [Using an IAM role to grant permissions to applications running on Amazon EC2 instances](#) in the *IAM User Guide*.

To learn whether to use IAM roles or IAM users, see [When to create an IAM role \(instead of a user\)](#) in the *IAM User Guide*.

## Managing Access Using Policies

You control access in Amazon by creating policies and attaching them to IAM identities or Amazon resources. A policy is an object in Amazon that, when associated with an identity or resource, defines their permissions. You can sign in as the root user or an IAM user, or you can assume an IAM role. When you then make a request, Amazon evaluates the related identity-based or resource-based policies. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in Amazon as JSON documents. For more information about the structure and contents of JSON policy documents, see [Overview of JSON policies](#) in the *IAM User Guide*.

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

Every IAM entity (user or role) starts with no permissions. In other words, by default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the Amazon Web Services Management Console, the Amazon CLI, or the Amazon API.

### Identity-Based Policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see [Creating IAM policies](#) in the *IAM User Guide*.

Identity-based policies can be further categorized as *inline policies* or *managed policies*. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your Amazon account. Managed policies include Amazon managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see [Choosing between managed policies and inline policies](#) in the *IAM User Guide*.

### Resource-Based Policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are *IAM role trust policies* and *Amazon S3 bucket policies*. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must [specify a principal](#) in a resource-based policy. Principals can include accounts, users, roles, federated users, or Amazon services.

Resource-based policies are inline policies that are located in that service. You can't use Amazon managed policies from IAM in a resource-based policy.

### Access Control Lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, Amazon WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see [Access control list \(ACL\) overview](#) in the *Amazon Simple Storage Service Developer Guide*.

## Other Policy Types

Amazon supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the `Principal` field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see [Permissions boundaries for IAM entities](#) in the *IAM User Guide*.
- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in Amazon Organizations. Amazon Organizations is a service for grouping and centrally managing multiple Amazon accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each Amazon account root user. For more information about Organizations and SCPs, see [How SCPs work](#) in the *Amazon Organizations User Guide*.
- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see [Session policies](#) in the *IAM User Guide*.

## Multiple Policy Types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how Amazon determines whether to allow a request when multiple policy types are involved, see [Policy evaluation logic](#) in the *IAM User Guide*.

## How Amazon SageMaker Works with IAM

Before you use IAM to manage access to SageMaker, you should understand what IAM features are available to use with SageMaker. To get a high-level view of how SageMaker and other Amazon services work with IAM, see [Amazon Services That Work with IAM](#) in the *IAM User Guide*.

### Topics

- [SageMaker Identity-Based Policies](#) (p. 2421)

## SageMaker Identity-Based Policies

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. SageMaker supports specific actions, resources, and condition keys. To learn about all of the elements that you use in a JSON policy, see [IAM JSON Policy Elements Reference](#) in the *IAM User Guide*.

### Actions

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The **Action** element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated Amazon API operation. There are some exceptions, such as *permission-only actions* that don't have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called *dependent actions*.

Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in SageMaker use the following prefix before the action: `sagemaker::`. For example, to grant someone permission to run a SageMaker training job with the SageMaker `CreateTrainingJob` API operation, you include the `sagemaker:CreateTrainingJob` action in their policy. Policy statements must include either an **Action** or **NotAction** element. SageMaker defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": [  
    "sagemaker:action1",  
    "sagemaker:action2"  
]
```

You can specify multiple actions using wildcards (\*). For example, to specify all actions that begin with the word `Describe`, include the following action:

```
"Action": "sagemaker:Describe*"
```

To see a list of SageMaker actions, see [Actions, resources, and condition keys for Amazon SageMaker](#) in the *Service Authorization Reference*.

## Resources

SageMaker does not support specifying resource ARNs in a policy.

## Condition Keys

Administrators can use Amazon JSON policies to specify who has access to what. That is, which **principal** can perform **actions** on what **resources**, and under what **conditions**.

The **Condition** element (or **Condition block**) lets you specify conditions in which a statement is in effect. The **Condition** element is optional. You can create conditional expressions that use [condition operators](#), such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple **Condition** elements in a statement, or multiple keys in a single **Condition** element, Amazon evaluates them using a logical **AND** operation. If you specify multiple values for a single condition key, Amazon evaluates the condition using a logical **OR** operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see [IAM policy elements: variables and tags](#) in the *IAM User Guide*.

Amazon supports global condition keys and service-specific condition keys. To see all Amazon global condition keys, see [Amazon global condition context keys](#) in the *IAM User Guide*.

SageMaker defines its own set of condition keys and also supports using some global condition keys. To see all Amazon global condition keys, see [Amazon Global Condition Context Keys](#) in the *IAM User Guide*.

SageMaker supports a number of service-specific condition keys that you can use for fine-grained access control for the following operations:

- [CreateProcessingJob](#)
- [CreateTrainingJob](#)
- [CreateModel](#)
- [CreateEndpointConfig](#)
- [CreateTransformJob](#)
- [CreateHyperParameterTuningJob](#)
- [CreateLabelingJob](#)
- [CreateNotebookInstance](#)
- [UpdateNotebookInstance](#)

To see a list of SageMaker condition keys, see [Condition keys for Amazon SageMaker](#) in the *IAM User Guide*. To learn with which actions and resources you can use a condition key, see [Actions defined by Amazon SageMaker](#).

For examples of using SageMaker condition keys, see the following: [Control Creation of SageMaker Resources with Condition Keys \(p. 2434\)](#).

## Examples

To view examples of SageMaker identity-based policies, see [Amazon SageMaker Identity-Based Policy Examples \(p. 2424\)](#).

## SageMaker Resource-Based Policies

SageMaker does not support resource-based policies.

## Authorization Based on SageMaker Tags

You can attach tags to SageMaker resources or pass tags in a request to SageMaker. To control access based on tags, you provide tag information in the `condition element` of a policy using the `sagemaker:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys. For more information about tagging SageMaker resources, see [Control Access to SageMaker Resources by Using Tags \(p. 2444\)](#).

To view an example identity-based policy for limiting access to a resource based on the tags on that resource, see [Control Access to SageMaker Resources by Using Tags \(p. 2444\)](#).

## SageMaker IAM Roles

An [IAM role](#) is an entity within your Amazon account that has specific permissions.

### Using Temporary Credentials with SageMaker

You can use temporary credentials to sign in with federation, assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling Amazon STS API operations such as `AssumeRole` or `GetFederationToken`.

SageMaker supports using temporary credentials.

### Service-Linked Roles

SageMaker doesn't support service-linked roles.

## Service Roles

This feature allows a service to assume a [service role](#) on your behalf. This role allows the service to access resources in other services to complete an action on your behalf. Service roles appear in your IAM account and are owned by the account. This means that an IAM administrator can change the permissions for this role. However, doing so might break the functionality of the service.

SageMaker supports service roles.

### Choosing an IAM Role in SageMaker

When you create a notebook instance, processing job, training job, hosted endpoint, or batch transform job resource in SageMaker, you must choose a role to allow SageMaker to access SageMaker on your behalf. If you have previously created a service role or service-linked role, then SageMaker provides you with a list of roles to choose from. It's important to choose a role that allows access to the Amazon operations and resources you need. For more information, see [SageMaker Roles \(p. 2447\)](#).

## Amazon SageMaker Identity-Based Policy Examples

By default, IAM users and roles don't have permission to create or modify SageMaker resources. They also can't perform tasks using the Amazon Web Services Management Console, Amazon CLI, or Amazon API. An IAM administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the IAM users or groups that require those permissions. To learn how to attach policies to an IAM user or group, see [Adding and Removing IAM Identity Permissions](#) in the *IAM User Guide*.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see [Creating Policies on the JSON Tab](#) in the *IAM User Guide*.

## Policy Best Practices

Identity-based policies are very powerful. They determine whether someone can create, access, or delete SageMaker resources in your account. These actions can incur costs for your Amazon account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- **Get started using Amazon managed policies** – To start using SageMaker quickly, use Amazon managed policies to give your employees the permissions they need. These policies are already available in your account and are maintained and updated by Amazon. For more information, see [Get started using permissions with Amazon managed policies](#) in the *IAM User Guide*.
- **Grant least privilege** – When you create custom policies, grant only the permissions required to perform a task. Start with a minimum set of permissions and grant additional permissions as

necessary. Doing so is more secure than starting with permissions that are too lenient and then trying to tighten them later. For more information, see [Grant least privilege](#) in the *IAM User Guide*.

- **Enable MFA for sensitive operations** – For extra security, require IAM users to use multi-factor authentication (MFA) to access sensitive resources or API operations. For more information, see [Using multi-factor authentication \(MFA\) in Amazon](#) in the *IAM User Guide*.
- **Use policy conditions for extra security** – To the extent that it's practical, define the conditions under which your identity-based policies allow access to a resource. For example, you can write conditions to specify a range of allowable IP addresses that a request must come from. You can also write conditions to allow requests only within a specified date or time range, or to require the use of SSL or MFA. For more information, see [IAM JSON policy elements: Condition](#) in the *IAM User Guide*.

## Using the SageMaker Console

To access the Amazon SageMaker console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the SageMaker resources in your Amazon account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (IAM users or roles) with that policy.

To ensure that those entities can still use the SageMaker console, also attach the following Amazon managed policy to the entities. For more information, see [Adding Permissions to a User](#) in the *IAM User Guide*:

You don't need to allow minimum console permissions for users that are making calls only to the Amazon CLI or the Amazon API. Instead, allow access to only the actions that match the API operation that you're trying to perform.

### Topics

- [Permissions Required to Use the Amazon SageMaker Console \(p. 2425\)](#)
- [Permissions Required to Use the Amazon SageMaker Ground Truth Console \(p. 2427\)](#)
- [Permissions Required to Use the Amazon Augmented AI \(Preview\) Console \(p. 2428\)](#)

## Permissions Required to Use the Amazon SageMaker Console

The permissions reference table lists the Amazon SageMaker API operations and shows the required permissions for each operation. For more information about Amazon SageMaker API operations, see [Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference \(p. 2474\)](#).

To use the Amazon SageMaker console, you need to grant permissions for additional actions. Specifically, the console needs permissions that allow the `ec2` actions to display subnets, VPCs, and security groups. Optionally, the console needs permission to create *execution roles* for tasks such as `CreateNotebook`, `CreateTrainingJob`, and `CreateModel`. Grant these permissions with the following permissions policy:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "SageMakerApis",  
            "Effect": "Allow",  
            "Action": [  
                "sagemaker:*"  
            ],  
            "Resource": "*"  
        },  
        {  
            "Sid": "VPCActions",  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeSubnets",  
                "ec2:DescribeVpcs",  
                "ec2:DescribeSecurityGroups"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

```

    "Sid": "VpcConfigurationForCreateForms",
    "Effect": "Allow",
    "Action": [
        "ec2:DescribeVpcs",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
    ],
    "Resource": "*"
},
{
    "Sid": "KmsKeysForCreateForms",
    "Effect": "Allow",
    "Action": [

    "Action": [
        "iam:PassRole"
    ],
    "Resource": "*",
}

```

```

        "Condition": {
            "StringEquals": {
                "iam:PassedToService": "sagemaker.amazonaws.com"
            }
        }
    ]
}

```

## Permissions Required to Use the Amazon SageMaker Ground Truth Console

To use the Amazon SageMaker Ground Truth console, you need to grant permissions for additional resources. Specifically, the console needs permissions for the Amazon Marketplace to view subscriptions, Amazon Cognito operations to manage your private workforce, Amazon S3 actions for access to your input and output files, and Amazon Lambda actions to list and invoke functions. Grant these permissions with the following permissions policy:

```

{
    "Version": "2012-10-17",

## Allow Users to View Their Own Permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the Amazon CLI or Amazon API.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "ViewOwnUserInfo",
            "Effect": "Allow",
            "Action": [
                "iam:GetUserPolicy",

```

```
        "iam>ListGroupsForUser",
        "iam>ListAttachedUserPolicies",
        "iam>ListUserPolicies",
        "iam GetUser"
    ],
    "Resource": ["arn:aws-cn:iam::*:user/${aws:username}"]
},
{
    "Sid": "NavigateInConsole",
    "Effect": "Allow",
    "Action": [
        "iam:GetGroupPolicy",
        "iam:GetPolicyVersion",
        "iam:GetPolicy",
        "iam>ListAttachedGroupPolicies",
        "iam>ListGroupPolicies",
        "iam>ListPolicyVersions",
        "iam>ListPolicies",
        "iam>ListUsers"
    ],
    "Resource": "*"
}
]
```

## Control Creation of SageMaker Resources with Condition Keys

Control fine-grained access to allow the creation of SageMaker resources by using SageMaker-specific condition keys. For information about using condition keys in IAM policies, see [IAM JSON Policy Elements: Condition](#) in the *IAM User Guide*.

The condition keys, along with related API actions, and links to relevant documentation are listed in [Condition Keys for SageMaker](#) in the *IAM User Guide*.

The following examples show how to use the SageMaker condition keys to control access.

### Topics

- [Control Access to SageMaker Resources by Using File System Condition Keys \(p. 2434\)](#)
- [Restrict Training to a Specific VPC \(p. 2436\)](#)
- [Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows \(p. 2437\)](#)
- [Enforce Encryption of Input Data \(p. 2438\)](#)
- [Enforce Encryption of Notebook Instance Storage Volume \(p. 2438\)](#)
- [Enforce Network Isolation for Training Jobs \(p. 2439\)](#)
- [Enforce a Specific Instance Type for Training Jobs \(p. 2439\)](#)
- [Enforce a Specific EI Accelerator for Training Jobs \(p. 2440\)](#)
- [Enforce Disabling Internet Access and Root Access for Creating Notebook Instances \(p. 2440\)](#)

## Control Access to SageMaker Resources by Using File System Condition Keys

SageMaker training provides a secure infrastructure for the training algorithm to run in, but for some cases you may want increased defense in depth. For example, you minimize the risk of running untrusted code in your algorithm, or you have specific security mandates in your organization. For these scenarios, you can use the service-specific condition keys in the Condition element of an IAM policy to scope down the user to specific file systems, directories, access modes (read-write, read-only) and security groups.

### Topics

- [Restrict an IAM User to Specific Directories and Access Modes \(p. 2435\)](#)
- [Restrict an IAM User to a Specific File System \(p. 2435\)](#)

### [Restrict an IAM User to Specific Directories and Access Modes](#)

The policy below restricts an IAM user to the `/sagemaker/xgboost-dm/train` and `/sagemaker/xgboost-dm/validation` directories of an EFS file system to `ro` (read-only) AccessMode:

**Note**

When a directory is allowed, all of its subdirectories are also accessible by the training algorithm. POSIX permissions are ignored.

```
{

                    "sagemaker:FileSystemId": "fs-12345678",
                    "sagemaker:FileSystemAccessMode": "ro",
                    "sagemaker:FileSystemType": "EFS",
                    "sagemaker:FileSystemDirectoryPath": "/sagemaker/xgboost-dm/validation"
                }
            }
        }
    ]
}
```

### [Restrict an IAM User to a Specific File System](#)

To prevent a malicious algorithm using a user space client from accessing any file system directly in your account, you can restrict networking traffic by allowing ingress from a specific security group. In the following example, the IAM user can only use the specified security group to access the file system:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {

```

```
        "Sid": "AccessToLustreFileSystem",
        "Effect": "Allow",
        "Action": [
            "sagemaker>CreateTrainingJob",
            "sagemaker>CreateHyperParameterTuningJob"
        ],
        "Resource": "*",
        "Condition": {
            "StringEquals": {
                "sagemaker:FileSystemId": "fs-12345678",
                "sagemaker:FileSystemAccessMode": "ro",
                "sagemaker:FileSystemType": "FSxLustre",
                "sagemaker:FileSystemDirectoryPath": "/fsx/sagemaker/xgboost/train"
            },
            "ForAllValues:StringEquals": {
                "sagemaker:VpcSecurityGroupIds": [
                    "sg-12345678"
                ]
            }
        }
    }
]
```

Although the above example can restrict an algorithm to a specific file system, it does not prevent an algorithm from accessing any directory within that file system using the user space client. To mitigate this, you can:

- Ensure that the file system only contains data that you trust your IAM users to access
  - Create an IAM role that restricts your IAM users to launching training jobs with algorithms from approved ECR repositories

For more information on how to use roles with SageMaker, see [SageMaker Roles](#).

## Restrict Training to a Specific VPC

Restrict an Amazon user to creating training jobs from within a Amazon VPC. When a training job is created within a VPC, you can use VPC flow logs to monitor all traffic to and from the training cluster. For information about using VPC flow logs, see [VPC Flow Logs](#) in the *Amazon Virtual Private Cloud User Guide*.

The following policy enforces that a training job is created by an IAM user calling `CreateTrainingJob` from within a VPC:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "AllowFromVpc",  
            "Effect": "Allow",  
            "Action": [  
                "sagemaker:CreateTrainingJob",  
                "sagemaker:CreateHyperParameterTuningJob"  
            ],  
            "Resource": "*",  
            "Condition": {  
                "ForAllValues:StringEquals": {  
                    "sagemaker:VpcSubnets": ["subnet-a1234"],  
                    "sagemaker:VpcSecurityGroupIds": ["sg12345", "sg-67890"]  
                },  
                "Null": {  
                    "aws:SourceVpc": "  
                }  
            }  
        }  
    ]  
}
```

```

        "sagemaker:VpcSubnets": "false",
        "sagemaker:VpcSecurityGroupIds": "false"
    }
}
]
}
```

## Restrict Access to Workforce Types for Ground Truth Labeling Jobs and Amazon A2I Human Review Workflows

Amazon SageMaker Ground Truth and Amazon Augmented AI work teams fall into one of three [workforce types](#): public (with Amazon Mechanical Turk), private, and vendor. To restrict IAM user access to a specific work team using one of these types or the work team ARN, use the `sagemaker:WorkteamType` and/or the `sagemaker:WorkteamArn` condition keys. For the `sagemaker:WorkteamType` condition key, use [string condition operators](#). For the `sagemaker:WorkteamArn` condition key, use [Amazon Resource Name \(ARN\) condition operators](#). If the user attempts to create a labeling job with a restricted work team, SageMaker returns an access denied error.

The policies below demonstrate different ways to use the `sagemaker:WorkteamType` and `sagemaker:WorkteamArn` condition keys with appropriate condition operators and valid condition values.

The following example uses the `sagemaker:WorkteamType` condition key with the `StringEquals` condition operator to restrict access to a public work team. It accepts condition values in the following format: `workforcetype-crowd`, where `workforcetype` can equal `public`, `private`, or `vendor`.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker>CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:WorkteamType": "public-crowd"
                }
            }
        }
    ]
}
```

The following policies show how to restrict access to a public work team using the `sagemaker:WorkteamArn` condition key. The first shows how to use it with a valid IAM regex-variant of the work team ARN and the `ArnLike` condition operator. The second shows how to use it with the `ArnEquals` condition operator and the work team ARN.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker>CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnLike": {

```

```
*"
        }
    }
}
]

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "RestrictWorkteamType",
            "Effect": "Deny",
            "Action": "sagemaker>CreateLabelingJob",
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                    "sagemaker:WorkteamArn": "arn:aws:sagemaker:us-west-2:394669845002:workteam/public-crowd/default"
                }
            }
        }
    ]
}
```

## Enforce Encryption of Input Data

The following policy restricts an IAM user to specify a Amazon KMS key to encrypt input data when creating training, hyperparameter tuning, and labeling jobs by using the `sagemaker:VolumeKmsKey` condition key:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceEncryption",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreateTrainingJob",
                "sagemaker>CreateHyperParameterTuningJob",
                "sagemaker>CreateLabelingJob",
                "sagemaker>CreateFlowDefiniton"
            ],
            "Resource": "*",
            "Condition": {
                "ArnEquals": {
                    "sagemaker:VolumeKmsKey": "arn:aws:kms:us-west-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"
                }
            }
        }
    ]
}
```

## Enforce Encryption of Notebook Instance Storage Volume

The following policy restricts an IAM user to specify a Amazon KMS key to encrypt the attached storage volume when creating or updating a notebook instance by using the `sagemaker:VolumeKmsKey` condition key:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceEncryption",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "sagemaker:VolumeKmsKey": "*key/volume-kms-key-12345"
                }
            }
        }
    ]
}
```

## Enforce Network Isolation for Training Jobs

The following policy restricts an IAM user to enable network isolation when creating training jobs by using the `sagemaker:NetworkIsolation` condition key:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceIsolation",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "Bool": {
                    "sagemaker:NetworkIsolation": "true"
                }
            }
        }
    ]
}
```

## Enforce a Specific Instance Type for Training Jobs

The following policy restricts an IAM user to use a specific instance type when creating training jobs by using the `sagemaker:InstanceTypes` condition key:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceInstanceType",
            "Effect": "Allow",
            "Action": [
                "sagemaker:CreateTrainingJob",
                "sagemaker:CreateHyperParameterTuningJob"
            ],
            "Resource": "*",
            "Condition": {
                "String": {
                    "sagemaker:InstanceTypes": "ml.m5.xlarge"
                }
            }
        }
    ]
}
```

```

        "Condition": {
            "ForAllValues:StringLike": {
                "sagemaker:InstanceTypes": ["ml.c5.*"]
            }
        }
    ]
}

```

## Enforce a Specific EI Accelerator for Training Jobs

The following policy restricts an IAM user to use a specific elastic inference (EI) accelerator, if an accelerator is provided, when creating or updating notebook instances and when creating endpoint configurations by using the `sagemaker:AcceleratorTypes` condition key:

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "EnforceAcceleratorType",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreateNotebookInstance",
                "sagemaker:UpdateNotebookInstance",
                "sagemaker>CreateEndpointConfig"
            ],
            "Resource": "*",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "sagemaker:AcceleratorTypes": ["ml.eia1.medium"]
                }
            }
        }
    ]
}

```

## Enforce Disabling Internet Access and Root Access for Creating Notebook Instances

You can disable both internet access and root access to notebook instances to help make them more secure. For information about controlling root access to a notebook instance, see [Control root access to a SageMaker notebook instance \(p. 2412\)](#). For information about disabling internet access for a notebook instance, see [Connect a Notebook Instance to Resources in a VPC \(p. 2493\)](#).

The following policy requires an IAM user to disable network access when creating instance, and disable root access when creating or updating a notebook instance.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "LockDownCreateNotebookInstance",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreateNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {

```

```

        "StringEquals": {
            "sagemaker:DirectInternetAccess": "Disabled",
            "sagemaker:RootAccess": "Disabled"
        },
        "Null": {
            "sagemaker:VpcSubnets": "false",
            "sagemaker:VpcSecurityGroupIds": "false"
        }
    }
}

{
    "Sid": "LockDownUpdateNotebookInstance",
    "Effect": "Allow",
    "Action": [
        "sagemaker:UpdateNotebookInstance"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "sagemaker:RootAccess": "Disabled"
        }
    }
}
]
}

```

## Control Access to the SageMaker API by Using Identity-based Policies

To control access to SageMaker API calls and calls to SageMaker hosted endpoints, use identity-based IAM policies.

### Topics

- [Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC \(p. 2441\)](#)

## Restrict Access to SageMaker API and Runtime to Calls from Within Your VPC

If you set up an interface endpoint in your VPC, individuals outside the VPC can still connect to the SageMaker API and runtime over the internet unless you attach an IAM policy that restricts access to calls coming from within the VPC to all users and groups that have access to your SageMaker resources. For information about creating a VPC interface endpoint for the SageMaker API and runtime, see [Connect to SageMaker Through a VPC Interface Endpoint \(p. 2495\)](#).

### Important

If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs through the console.

To restrict access to only connections made from within your VPC, create an Amazon Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every Amazon Identity and Access Management user, group, or role used to access the SageMaker API or runtime.

### Note

This policy allows connections only to callers within a subnet where you created an interface endpoint.

```
{
    "Id": "api-example-1",
    "Version": "2012-10-17",
}
```

```

"Statement": [
    {
        "Sid": "Enable API Access",
        "Effect": "Allow",
        "Action": [
            "sagemaker:*"
        ],
        "Resource": "*",
        "Condition": {
            "StringEquals": {
                "aws:SourceVpc": "vpc-111bbaaa"
            }
        }
    }
]
}

```

If you want to restrict access to the API to only calls made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```

{
    "Id": "api-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable API Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreatePresignedNotebookInstanceUrl"
            ],
            "Resource": "*",
            "Condition": {
                "ForAllValues:StringEquals": {
                    "aws:sourceVpce": [
                        "vpce-111bbccc",
                        "vpce-111bbddd"
                    ]
                }
            }
        }
    ]
}

```

## Limit Access to SageMaker API and Runtime Calls by IP Address

To allow access to SageMaker API calls and runtime invocations only from IP addresses in a list that you specify, attach an IAM policy that denies access to the API unless the call comes from an IP address in the list to every Amazon Identity and Access Management user, group, or role used to access the API or runtime. For information about creating IAM policies, see [Creating IAM Policies](#) in the *Amazon Identity and Access Management User Guide*. To specify the list of IP addresses that you want to have access to the API call, use the `IpAddress` condition operator and the `aws:SourceIP` condition context key. For information about IAM condition operators, see [IAM JSON Policy Elements: Condition Operators](#) in the *Amazon Identity and Access Management User Guide*. For information about IAM condition context keys, see [Amazon Global Condition Context Keys](#).

For example, the following policy allows access to the `CreateTrainingJob` only from IP addresses in the ranges 192.0.2.0-192.0.2.255 and 203.0.113.0-203.0.113.255:

```

{
    "Version": "2012-10-17",

```

```

"Statement": [
    {
        "Effect": "Allow",
        "Action": "sagemaker>CreateTrainingJob",
        "Resource": "*",
        "Condition": {
            "IpAddress": {
                "aws:SourceIp": [
                    "192.0.2.0/24",
                    "203.0.113.0/24"
                ]
            }
        }
    }
]
}

```

## Limit Access to a Notebook Instance by IP Address

To allow access to a notebook instance only from IP addresses in a list that you specify, attach an IAM policy that denies access to `CreatePresignedNotebookInstanceUrl` unless the call comes from an IP address in the list to every Amazon Identity and Access Management user, group, or role used to access the notebook instance. For information about creating IAM policies, see [Creating IAM Policies](#) in the *Amazon Identity and Access Management User Guide*. To specify the list of IP addresses that you want to have access to the notebook instance, use the `IpAddress` condition operator and the `aws:SourceIP` condition context key. For information about IAM condition operators, see [IAM JSON Policy Elements: Condition Operators](#) in the *Amazon Identity and Access Management User Guide*. For information about IAM condition context keys, see [Amazon Global Condition Context Keys](#).

For example, the following policy allows access to a notebook instance only from IP addresses in the ranges 192.0.2.0-192.0.2.255 and 203.0.113.0-203.0.113.255:

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker>CreatePresignedNotebookInstanceUrl",
            "Resource": "*",
            "Condition": {
                "IpAddress": {
                    "aws:SourceIp": [
                        "192.0.2.0/24",
                        "203.0.113.0/24"
                    ]
                }
            }
        }
    ]
}

```

The policy restricts access to both the call to `CreatePresignedNotebookInstanceUrl` and to the URL that the call returns. The policy also restricts access to opening a notebook instance in the console and is enforced for every HTTP request and WebSocket frame that attempts to connect to the notebook instance.

**Note**

Using this method to filter by IP address is incompatible when [connecting to SageMaker through a VPC interface endpoint](#). For information about restricting access to a notebook

instance when connecting through a VPC interface endpoint, see [Connect to a Notebook Instance Through a VPC Interface Endpoint \(p. 2497\)](#).

## Control Access to SageMaker Resources by Using Tags

Control access to groups of SageMaker resources by attaching tags to the resources and specifying `ResourceTag` conditions in IAM policies.

### Note

Tag-based policies don't work to restrict the following API calls:

- `ListAlgorithms`
- `ListCodeRepositories`
- `ListCompilationJobs`
- `ListEndpointConfigs`
- `ListEndpoints`
- `ListFlowDefinitions`
- `ListHumanTaskUis`
- `ListHyperparameterTuningJobs`
- `ListLabelingJobs`
- `ListLabelingJobsForWorkteam`
- `ListModelPackages`
- `ListModels`
- `ListNotebookInstanceLifecycleConfigs`
- `ListNotebookInstances`
- `ListSubscribedWorkteams`
- `ListTags`
- `ListProcessingJobs`
- `ListTrainingJobs`
- `ListTrainingJobsForHyperParameterTuningJob`
- `ListTransformJobs`
- `ListWorkteams`
- `Search`

For example, suppose you've defined two different IAM groups, named `DevTeam1` and `DevTeam2`, in your Amazon account. Suppose also that you've created 10 notebook instances, 5 of which are used for one project, and 5 of which are used for a second project. You want to allow members of `DevTeam1` to make API calls on notebook instances used for the first project, and members of `DevTeam2` to make API calls on notebook instances used for the second project.

### To control access to API calls (example)

1. Add a tag with the key `Project` and value `A` to the notebook instances used for the first project. For information about adding tags to SageMaker resources, see [AddTags](#).
2. Add a tag with the key `Project` and value `B` to the notebook instances used for the second project.
3. Create an IAM policy with a `ResourceTag` condition that denies access to the notebook instances used for the second project, and attach that policy to `DevTeam1`. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of `Project` and a value of `B`:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "sagemaker:*",
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": "sagemaker:*",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:ResourceTag/Project": "B"
                }
            }
        },
        {
            "Effect": "Deny",
            "Action": [
                "sagemaker:AddTags",
                "sagemaker:DeleteTags"
            ],
            "Resource": "*"
        }
    ]
}
```

For information about creating IAM policies and attaching them to identities, see [Controlling Access Using Policies](#) in the *Amazon Identity and Access Management User Guide*.

4. Create an IAM policy with a ResourceTag condition that denies access to the notebook instances used for the first project, and attach that policy to DevTeam2. The following is an example of a policy that denies all API calls on any notebook instance that has a tag with a key of Project and a value of A:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "*",
            "Resource": "*"
        },
        {
            "Effect": "Deny",
            "Action": "sagemaker:*",
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "sagemaker:ResourceTag/Project": "A"
                }
            }
        },
        {
            "Effect": "Deny",
            "Action": [
                "sagemaker:AddTags",
                "sagemaker:DeleteTags"
            ],
            "Resource": "*"
        }
    ]
}
```

```
    ]  
}
```

## Require the Presence or Absence of Tags for API Calls

Require the presence or absence of specific tags or specific tag values by using `RequestTag` condition keys in an IAM policy. For example, if you want to require that every endpoint created by any member of an IAM group to be created with a tag with the key `environment` and value `dev`, create a policy as follows:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "*",
      "Resource": "*"
    },
    {
      "Effect": "Deny",
      "Action": "sagemaker>CreateEndpoint",
      "Resource": "arn:aws:sagemaker:*::endpoint/*",
      "Condition": {
        "StringNotEquals": {
          "aws:RequestTag/environment": "dev"
        }
      }
    }
  ]
}
```

## Use Tags with Hyperparameter Tuning Jobs

You can add tags to a hyperparameter tuning job when you create the tuning job by specifying the tags as the `Tags` parameter when you call [CreateHyperParameterTuningJob](#). If you do this, the tags you specify for the hyperparameter tuning job are also added to all training jobs that the hyperparameter tuning job launches.

If you add tags to a hyperparameter tuning job by calling [AddTags](#), the tags you add are also added to any training jobs that the hyperparameter tuning job launches after you call [AddTags](#), but are not added to training jobs the hyperparameter tuning jobs launched before you called [AddTags](#). Similarly, when you remove tags from a hyperparameter tuning job by calling [DeleteTags](#), those tags are not removed from training jobs that the hyperparameter tuning job launched previously. Because of this, the tags associated with training jobs can be out of sync with the tags associated with the hyperparameter tuning job that launched them. If you use tags to control access to a hyperparameter tuning job and the training jobs it launches, you might want to keep the tags in sync. To make sure the tags associated with training jobs stay sync with the tags associated with the hyperparameter tuning job that launched them, first call [ListTrainingJobsForHyperParameterTuningJob](#) for the hyperparameter tuning job to get a list of the training jobs that the hyperparameter tuning job launched. Then, call [AddTags](#) or [DeleteTags](#) for the hyperparameter tuning job and for each of the training jobs in the list of training jobs to add or delete the same set of tags for all of the jobs. The following Python example demonstrates this:

```
tuning_job_arn =
smclient.describe_hyper_parameter_tuning_job(HyperParameterTuningJobName='MyTuningJob')
['HyperParameterTuningJobArn']
smclient.add_tags(ResourceArn=tuning_job_arn, Tags=[{'Key': 'Env', 'Value': 'Dev'}])
training_jobs = smclient.list_training_jobs_for_hyper_parameter_tuning_job(
    HyperParameterTuningJobName='MyTuningJob')['TrainingJobSummaries']
for training_job in training_jobs:
```

```
time.sleep(1) # Wait for 1 second between calls to avoid being throttled
smclient.add_tags(ResourceArn=training_job['TrainingJobArn'], Tags=[{'Key': 'Env',
'Value':'Dev'}])
```

## SageMaker Roles

As a managed service, SageMaker performs operations on your behalf on the Amazon hardware that is managed by SageMaker. SageMaker can perform only operations that the user permits.

A SageMaker user can grant these permissions with an IAM role (referred to as an execution role).

To create and use a locally available execution role, you can use the following procedures.

### Get execution role

When you run a notebook within SageMaker you can access the execution role with the following code:

```
sagemaker_session = sagemaker.Session()
role = sagemaker.get_execution_role()
```

#### Note

The execution role is intended to be available only when running a notebook within SageMaker. If you run `get_execution_role` in a notebook not on SageMaker, expect a "region" error.

To find the IAM role ARN created when you created your the notebook instance or Studio application, go to the **Notebook instances** page in the console and select the relevant notebook from the list of **Names**. In the configuration detail page the IAM role ARN is given in the **Permissions and encryption** section.

Use the following procedure to create an execution role with the IAM managed policy, `AmazonSageMakerFullAccess`, attached. If your use case requires more granular permissions, use other sections on this page to create an execution role that meets your business needs.

#### Important

The IAM managed policy, `AmazonSageMakerFullAccess`, used in the following procedure only grants the execution role permission to perform certain Amazon S3 actions on buckets or objects with SageMaker, Sagemaker, sagemaker, or aws-glue in the name. To learn how to add an additional policy to an execution role to grant it access to other Amazon S3 buckets and objects, see [Add Additional Amazon S3 Permissions to an SageMaker Execution Role \(p. 2448\)](#).

### To create a new role

1. Open the IAM console at <https://console.amazonaws.cn/iam/>.
2. Select **Roles** and then select **Create role**.
3. Select **SageMaker**.
4. Select **Next: Permissions**.
5. The IAM managed policy, `AmazonSageMakerFullAccess` is automatically attached to this role. To see the permissions included in this policy, select the sideways arrow next to the policy name. Select **Next: Tags**.
6. (Optional) Add tags and select **Next: Review**.
7. Give the role a name in the text field under **Role name** and select **Create role**.
8. On the **Roles** section of the IAM console, select the role you just created. If needed, use the text box to search for the role using the role name you entered in step 7.
9. On the role summary page, make note of the ARN.

With a known ARN for your role, you can programmatically check the role when running the notebook locally or on SageMaker. Replace `RoleName` with your known ARN:

```

try:
    role = sagemaker.get_execution_role()
except ValueError:
    iam = boto3.client('iam')
    role = iam.get_role(RoleName='AmazonSageMaker-ExecutionRole-20201200T100000')['Role']
    ['Arn']

```

## Add Additional Amazon S3 Permissions to an SageMaker Execution Role

When you use an SageMaker feature with resources in Amazon S3, such as input data, the execution role you specify in your request (for example `CreateTrainingJob`) is used to access these resources.

If you attach the IAM managed policy, `AmazonSageMakerFullAccess`, to an execution role, that role has permission to perform certain Amazon S3 actions on buckets or objects with `SageMaker`, `Sagemaker`, `sagemaker`, or `aws-glue` in the name. It also has permission to perform the following actions on any Amazon S3 resource:

```

"s3:CreateBucket",
"s3:GetBucketLocation",
"s3>ListBucket",
"s3>ListAllMyBuckets",
"s3:GetBucketCors",
"s3:PutBucketCors"

```

To give an execution role permissions to access one or more specific buckets in Amazon S3, you can attach a policy similar to the following to the role. This policy grants an IAM role permission to perform all actions that `AmazonSageMakerFullAccess` allows but restricts this access to the buckets and . Refer to the security documentation for the specific SageMaker feature you are using to learn more about the Amazon S3 permissions required for that feature.

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3>DeleteObject",
                "s3:AbortMultipartUpload"
            ],
            "Resource": [
                "arn:aws:s3:::/*",
                "arn:aws:s3:::/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:CreateBucket",
                "s3:GetBucketLocation",
                "s3>ListBucket",
                "s3>ListAllMyBuckets",
                "s3:GetBucketCors",
                "s3:PutBucketCors"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [

```

```
        "s3:GetBucketAcl",
        "s3:PutObjectAcl"
    ],
    "Resource": [
        "arn:aws:s3:::",
        "arn:aws:s3:::"
    ]
}
}
```

## Passing Roles

Actions like passing a role between services are a common function within SageMaker. You can find more details on [Actions, Resources, and Condition Keys for SageMaker](#) in the *IAM User Guide*.

You pass the role (`iam:PassRole`) when making these API calls: [CreateAutoMLJob](#), [CreateCompilationJob](#), [CreateDomain](#), [CreateFlowDefiniton](#), [CreateHyperParameterTuningJob](#), [CreateImage](#), [CreateLabelingJob](#), [CreateModel](#), [CreateMonitoringSchedule](#), [CreateNotebookInstance](#), [CreateProcessingJob](#), [CreateTrainingJob](#), [CreateUserProfile](#), [RenderUiTemplate](#), and [UpdateImage](#).

You attach the following trust policy to the IAM role which grants SageMaker principal permissions to assume the role, and is the same for all of the execution roles:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Principal": {
                "Service": "sagemaker.amazonaws.com"
            },
            "Action": "sts:AssumeRole"
        }
    ]
}
```

The permissions that you need to grant to the role vary depending on the API that you call. The following sections explain these permissions.

### Note

Instead of managing permissions by crafting a permission policy, you can use the Amazon-managed [AmazonSageMakerFullAccess](#) permission policy. The permissions in this policy are fairly broad, to allow for any actions you might want to perform in SageMaker. For a listing of the policy including information about the reasons for adding many of the permissions, see [AmazonSageMakerFullAccess \(p. 2465\)](#). If you prefer to create custom policies and manage permissions to scope the permissions only to the actions you need to perform with the execution role, see the following topics.

For more information about IAM roles, see [IAM Roles](#) in the *IAM User Guide*.

### Topics

- [CreateAutoMLJob API: Execution Role Permissions \(p. 2450\)](#)

- [CreateModel API: Execution Role Permissions \(p. 2462\)](#)

## CreateAutoMLJob API: Execution Role Permissions

For an execution role that you can pass in a CreateAutoMLJob API request, you can attach the following minimum permission policy to the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole",
                "sagemaker:DescribeEndpointConfig",
                "sagemaker:DescribeModel",
                "sagemaker:InvokeEndpoint",
                "sagemaker>ListTags",
                "sagemaker:DescribeEndpoint",
                "sagemaker>CreateModel",
                "sagemaker>CreateEndpointConfig",
                "sagemaker>CreateEndpoint",
                "sagemaker>DeleteModel",
                "sagemaker>DeleteEndpointConfig",
                "sagemaker>DeleteEndpoint",
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "s3:GetObject",
                "s3:PutObject",
                "s3>ListBucket",
                "ecr:GetAuthorizationToken",
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": "*"
        }
    ]
}
```

If you specify a private VPC for your AutoML job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "ec2>CreateNetworkInterface",
        "ec2>CreateNetworkInterfacePermission",
        "ec2>DeleteNetworkInterface",
        "ec2>DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfacePermissions",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
    ]
}
```

If your input is encrypted using server-side encryption with an Amazon KMS–managed key (SSE-KMS), add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Decrypt"
    ]
}
```

If you specify a KMS key in the output configuration of your AutoML job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Encrypt"
    ]
}
```

If you specify a volume KMS key in the resource configuration of your AutoML job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms>CreateGrant"
    ]
}
```

## CreateDomain API: Execution Role Permissions

The execution role for Amazon Web Services SSO domains and the user/execution role for IAM domains need the following permissions when you pass an Amazon KMS customer managed key (CMK) as the `KmsKeyId` in the `CreateDomain` API request. The permissions are enforced during the `CreateApp` API call.

For an execution role that you can pass in the `CreateDomain` API request, you can attach the following permission policy to the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "kms>CreateGrant",
                "kms:DescribeKey"
            ],
            "Resource": "arn:aws:kms:region:account-id:key/kms-key-id"
        },
    ]
}
```

Alternatively, if the permissions are specified in a KMS policy, you can attach the following policy to the role:

```
{
    "Sid": "Allow use of the key",
    "Effect": "Allow",
```

```

    "Principal": {
        "AWS": [
            "arn:aws:iam::account-id:role/ExecutionRole"
        ]
    },
    "Action": [
        "kms:DescribeKey",
        "kms>CreateGrant"
    ],
    "Resource": "*"
}

```

## CreatelImage and UpdatelImage APIs: Execution Role Permissions

For an execution role that you can pass in a `CreateImage` or `UpdateImage` API request, you can attach the following permission policy to the role:

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchGetImage",
                "ecr:GetDownloadUrlForLayer"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "sagemaker.amazonaws.com"
                }
            }
        }
    ]
}

```

## CreateNotebookInstance API: Execution Role Permissions

The permissions that you grant to the execution role for calling the `CreateNotebookInstance` API depend on what you plan to do with the notebook instance. If you plan to use it to invoke SageMaker APIs and pass the same role when calling the `CreateTrainingJob` and `CreateModel` APIs, attach the following permissions policy to the role:

```

{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:*",
                "ecr:GetAuthorizationToken",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage",
                "ecr:BatchCheckLayerAvailability",
                "ecr:SetRepositoryPolicy",
                "lambda:InvokeFunction"
            ],
            "Resource": "*"
        }
    ]
}

```

```

        "ecr:CompleteLayerUpload",
        "ecr:BatchDeleteImage",
        "ecr:UploadLayerPart",
        "ecr:DeleteRepositoryPolicy",
        "ecr:InitiateLayerUpload",
        "ecr:DeleteRepository",
        "ecr:PutImage",
        "ecr>CreateRepository",
        "cloudwatch:PutMetricData",
        "cloudwatch:GetMetricData",
        "cloudwatch:GetMetricStatistics",
        "cloudwatch>ListMetrics",
        "logs>CreateLogGroup",
        "logs>CreateLogStream",
        "logs>DescribeLogStreams",
        "logs>PutLogEvents",
        "logs>GetLogEvents",
        "s3>CreateBucket",
        "s3>ListBucket",
        "s3>GetBucketLocation",
        "s3>GetObject",
        "s3>PutObject",
        "s3>DeleteObject",
        "robomaker>CreateSimulationApplication",
        "robomaker>DescribeSimulationApplication",
        "robomaker>DeleteSimulationApplication",
        "robomaker>CreateSimulationJob",
        "robomaker>DescribeSimulationJob",
        "robomaker>CancelSimulationJob",
        "ec2>CreateVpcEndpoint",
        "ec2>DescribeRouteTables",
        "fsx>DescribeFileSystem",
        "elasticfilesystem>DescribeMountTargets"
    ],
    "Resource": "*"
},
{
    "Effect": "Allow",
    "Action": [
        "codecommit:GitPull",
        "codecommit:GitPush"
    ],
    "Resource": [
        "arn:aws:codecommit:*::*:sagemaker*",
        "arn:aws:codecommit:*::*:SageMaker*",
        "arn:aws:codecommit:*::*:Sagemaker*"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "iam:PassRole"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "iam:PassedToService": "sagemaker.amazonaws.com"
        }
    }
}
]
}

```

To tighten the permissions, limit them to specific Amazon S3 and Amazon ECR resources, by restricting `"Resource": "*"`, as follows:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "sagemaker:*",
                "ecr:GetAuthorizationToken",
                "cloudwatch:PutMetricData",
                "logs>CreateLogGroup",
                "logs>CreateLogStream",
                "logs:DescribeLogStreams",
                "logs:PutLogEvents",
                "logs:GetLogEvents"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:PassRole"
            ],
            "Resource": "*",
            "Condition": {
                "StringEquals": {
                    "iam:PassedToService": "sagemaker.amazonaws.com"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3>ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject",
                "s3:DeleteObject"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket/object1",
                "arn:aws:s3:::outputbucket/path",
                "arn:aws:s3:::inputbucket/object2",
                "arn:aws:s3:::inputbucket/object3"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": [
                "arn:aws:ecr:::repository/my-repo1",
                "arn:aws:ecr:::repository/my-repo2",
                "arn:aws:ecr:::repository/my-repo3"
            ]
        }
    ]
}
```

```
    ]
}
```

If you plan to access other resources, such as Amazon DynamoDB or Amazon Relational Database Service, add the relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3>ListBucket` permission to the specific bucket that you specify as `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope `s3GetObject`, `s3PutObject`, and `s3DeleteObject` permissions as follows:
  - Scope to the following values that you specify in a `CreateTrainingJob` request:

```
InputDataConfig.DataSource.S3DataSource.S3Uri
```

```
OutputDataConfig.S3OutputPath
```

- Scope to the following values that you specify in a `CreateModel` request:

```
PrimaryContainer.ModelDataUrl
```

```
SupplementalContainers.ModelDataUrl
```

- Scope `ecr` permissions as follows:

- Scope to the `AlgorithmSpecification.TrainingImage` value that you specify in a `CreateTrainingJob` request.

- Scope to the `PrimaryContainer.Image` value that you specify in a `CreateModel` request:

The `cloudwatch` and `logs` actions are applicable for `"*"` resources. For more information, see [CloudWatch Resources and Operations](#) in the Amazon CloudWatch User Guide.

## CreateHyperParameterTuningJob API: Execution Role Permissions

For an execution role that you can pass in a `CreateHyperParameterTuningJob` API request, you can attach the following permission policy to the role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "cloudwatch:PutMetricData",
        "logs:CreateLogStream",
        "logs:PutLogEvents",
        "logs:CreateLogGroup",
        "logs:DescribeLogStreams",
        "s3:GetObject",
        "s3:PutObject",
        "s3>ListBucket",
        "ecr:GetAuthorizationToken",
        "ecr:BatchCheckLayerAvailability",
        "ecr:GetDownloadUrlForLayer",
        "ecr:BatchGetImage"
      ],
      "Resource": "*"
    }
  ]
}
```

}

Instead of specifying "Resource": "\*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "ecr:GetAuthorizationToken"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3>ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket/object",
                "arn:aws:s3:::outputbucket/path"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": "arn:aws:ecr:::repository/my-repo"
        }
    ]
}
```

If the training container associated with the hyperparameter tuning job needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the s3>ListBucket permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the s3GetObject and s3PutObject permissions to the following objects that you specify in the input and output data configuration in a `CreateHyperParameterTuningJob` request:

`InputDataConfig.DataSource.S3DataSource.S3Uri`

`OutputDataConfig.S3OutputPath`

- Scope Amazon ECR permissions to the registry path (`AlgorithmSpecification.TrainingImage`) that you specify in a `CreateHyperParameterTuningJob` request.

The `cloudwatch` and `logs` actions are applicable for "\*" resources. For more information, see [CloudWatch Resources and Operations](#) in the Amazon CloudWatch User Guide.

If you specify a private VPC for your hyperparameter tuning job, add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateNetworkInterface",  
        "ec2:CreateNetworkInterfacePermission",  
        "ec2:DeleteNetworkInterface",  
        "ec2:DeleteNetworkInterfacePermission",  
        "ec2:DescribeNetworkInterfaces",  
        "ec2:DescribeVpcs",  
        "ec2:DescribeDhcpOptions",  
        "ec2:DescribeSubnets",  
        "ec2:DescribeSecurityGroups"  
    ]  
}
```

If your input is encrypted using server-side encryption with an Amazon KMS-managed key (SSE-KMS), add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "kms:Decrypt"  
    ]  
}
```

If you specify a KMS key in the output configuration of your hyperparameter tuning job, add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "kms:Encrypt"  
    ]  
}
```

If you specify a volume KMS key in the resource configuration of your hyperparameter tuning job, add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "kms>CreateGrant"  
    ]  
}
```

## CreateProcessingJob API: Execution Role Permissions

For an execution role that you can pass in a `CreateProcessingJob` API request, you can attach the following permission policy to the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "s3:GetObject",
                "s3:PutObject",
                "s3>ListBucket",
                "ecr:GetAuthorizationToken",
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": "*"
        }
    ]
}
```

Instead of specifying "Resource": "\*", you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "ecr:GetAuthorizationToken"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3>ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject",
                "s3:PutObject"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket/object",
                "arn:aws:s3:::outputbucket/path"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:ListBucket"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket"
            ]
        }
    ]
}
```

```

        "Action": [
            "ecr:BatchCheckLayerAvailability",
            "ecr:GetDownloadUrlForLayer",
            "ecr:BatchGetImage"
        ],
        "Resource": "arn:aws:ecr:::repository/my-repo"
    ]
}

```

If `CreateProcessingJob.AppSpecification.ImageUri` needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3>ListBucket` permission to a specific bucket that you specify as the `ProcessingInputs` in a `CreateProcessingJob` request.
- Scope the `s3GetObject` and `s3PutObject` permissions to the objects that will be downloaded or uploaded in the `ProcessingInputs` and `ProcessingOutputConfig` in a `CreateProcessingJob` request.
- Scope Amazon ECR permissions to the registry path (`AppSpecification.ImageUri`) that you specify in a `CreateProcessingJob` request.

The `cloudwatch` and `logs` actions are applicable for `"*"` resources. For more information, see [CloudWatch Resources and Operations](#) in the Amazon CloudWatch User Guide.

If you specify a private VPC for your processing job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateNetworkInterface",
        "ec2:CreateNetworkInterfacePermission",
        "ec2:DeleteNetworkInterface",
        "ec2:DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        "ec2:DescribeSecurityGroups"
    ]
}
```

If your input is encrypted using server-side encryption with an Amazon KMS–managed key (SSE-KMS), add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Decrypt"
    ]
}
```

If you specify a KMS key in the output configuration of your processing job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms:Encrypt"
    ]
}
```

```
}
```

If you specify a volume KMS key in the resource configuration of your processing job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "kms>CreateGrant"
    ]
}
```

## CreateTrainingJob API: Execution Role Permissions

For an execution role that you can pass in a `CreateTrainingJob` API request, you can attach the following permission policy to the role:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "s3:GetObject",
                "s3:PutObject",
                "s3>ListBucket",
                "ecr:GetAuthorizationToken",
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": "*"
        }
    ]
}
```

Instead of specifying `"Resource": "*"`, you could scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "ecr:GetAuthorizationToken"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": "arn:aws:s3:::mybucket/*"
        }
    ]
}
```

```

    "Action": [
        "s3>ListBucket"
    ],
    "Resource": [
        "arn:aws:s3:::inputbucket"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "s3:GetObject",
        "s3:PutObject"
    ],
    "Resource": [
        "arn:aws:s3:::inputbucket/object",
        "arn:aws:s3:::outputbucket/path"
    ]
},
{
    "Effect": "Allow",
    "Action": [
        "ecr:BatchCheckLayerAvailability",
        "ecr:GetDownloadUrlForLayer",
        "ecr:BatchGetImage"
    ],
    "Resource": "arn:aws:ecr:::repository/my-repo"
}
]
}

```

If `CreateTrainingJob.AlgorithmSpecifications.TrainingImage` needs to access other data sources, such as DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope the `s3>ListBucket` permission to a specific bucket that you specify as the `InputDataConfig.DataSource.S3DataSource.S3Uri` in a `CreateTrainingJob` request.
- Scope the `s3GetObject` and `s3PutObject` permissions to the following objects that you specify in the input and output data configuration in a `CreateTrainingJob` request:

`InputDataConfig.DataSource.S3DataSource.S3Uri`

`OutputDataConfig.S3OutputPath`

- Scope Amazon ECR permissions to the registry path (`AlgorithmSpecification.TrainingImage`) that you specify in a `CreateTrainingJob` request.

The `cloudwatch` and `logs` actions are applicable for `"*"` resources. For more information, see [CloudWatch Resources and Operations](#) in the Amazon CloudWatch User Guide.

If you specify a private VPC for your training job, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "ec2>CreateNetworkInterface",
        "ec2>CreateNetworkInterfacePermission",
        "ec2>DeleteNetworkInterface",
        "ec2>DeleteNetworkInterfacePermission",
        "ec2:DescribeNetworkInterfaces",
        "ec2:DescribeVpcs",
        "ec2:DescribeDhcpOptions",
        "ec2:DescribeSubnets",
        ...
    ],
    "Resource": [
        ...
    ]
}
```

```
"ec2:DescribeSecurityGroups"
```

If your input is encrypted using server-side encryption with an Amazon KMS–managed key (SSE-KMS), add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "kms:Decrypt"  
    ]  
}
```

If you specify a KMS key in the output configuration of your training job, add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "kms:Encrypt"  
    ]  
}
```

If you specify a volume KMS key in the resource configuration of your training job, add the following permissions:

```
{  
    "Effect": "Allow",  
    "Action": [  
        "kms>CreateGrant"  
    ]  
}
```

## CreateModel API: Execution Role Permissions

For an execution role that you can pass in a `CreateModel` API request, you can attach the following permission policy to the role:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "cloudwatch:PutMetricData",  
                "logs>CreateLogStream",  
                "logs:PutLogEvents",  
                "logs>CreateLogGroup",  
                "logs:DescribeLogStreams",  
                "s3:GetObject",  
                "ecr:GetAuthorizationToken",  
                "ecr:BatchCheckLayerAvailability",  
                "ecr:GetDownloadUrlForLayer",  
                "ecr:BatchGetImage"  
            ],  
            "Resource": "*"  
        }  
    ]  
}
```

Instead of specifying `"Resource": "*"`, you can scope these permissions to specific Amazon S3 and Amazon ECR resources:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "cloudwatch:PutMetricData",
                "logs>CreateLogStream",
                "logs:PutLogEvents",
                "logs>CreateLogGroup",
                "logs:DescribeLogStreams",
                "ecr:GetAuthorizationToken"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": [
                "s3:GetObject"
            ],
            "Resource": [
                "arn:aws:s3:::inputbucket/object",
                "arn:aws:s3:::inputbucket/object"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ecr:BatchCheckLayerAvailability",
                "ecr:GetDownloadUrlForLayer",
                "ecr:BatchGetImage"
            ],
            "Resource": [
                "arn:aws:ecr:::repository/my-repo",
                "arn:aws:ecr:::repository/my-repo"
            ]
        }
    ]
}
```

If `CreateModel.PrimaryContainer.Image` need to access other data sources, such as Amazon DynamoDB or Amazon RDS resources, add relevant permissions to this policy.

In the preceding policy, you scope the policy as follows:

- Scope S3 permissions to objects that you specify in the `PrimaryContainer.ModelDataUrl` in a [CreateModel](#) request.
- Scope Amazon ECR permissions to a specific registry path that you specify as the `PrimaryContainer.Image` and `SecondaryContainer.Image` in a [CreateModel](#) request.

The `cloudwatch` and `logs` actions are applicable for `"*"` resources. For more information, see [CloudWatch Resources and Operations](#) in the Amazon CloudWatch User Guide.

If you specify a private VPC for your model, add the following permissions:

```
{
    "Effect": "Allow",
    "Action": [
        "ec2>CreateNetworkInterface",
        "ec2>CreateNetworkInterfacePermission",
        "ec2>DeleteNetworkInterface",
        "ec2>DeleteNetworkInterfacePermission",
        ...
    ]
}
```

```
"ec2:DescribeNetworkInterfaces",
"ec2:DescribeVpcs",
"ec2:DescribeDhcpOptions",
"ec2:DescribeSubnets",
"ec2:DescribeSecurityGroups"
```

## Amazon Managed Policies for Amazon SageMaker

To add permissions to users, groups, and roles, it is easier to use Amazon managed policies than to write policies yourself. It takes time and expertise to [create IAM customer managed policies](#) that provide your team with only the permissions they need. To get started quickly, you can use our Amazon managed policies. These policies cover common use cases and are available in your Amazon account. For more information about Amazon managed policies, see [Amazon managed policies](#) in the *IAM User Guide*.

Amazon services maintain and update Amazon managed policies. You can't change the permissions in Amazon managed policies. Services occasionally add additional permissions to an Amazon managed policy to support new features. This type of update affects all identities (users, groups, and roles) to which the policy is attached. Services are most likely to update an Amazon managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an Amazon managed policy, so policy updates won't break your existing permissions.

Additionally, Amazon supports managed policies for job functions that span multiple services. For example, the `ReadOnlyAccess` Amazon managed policy provides read-only access to all Amazon services and resources. When a service launches a new feature, Amazon adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see [Amazon managed policies for job functions](#) in the *IAM User Guide*.

### Important

We recommend that you use the most restricted policy that allows you to perform your use case.

The following Amazon managed policies, which you can attach to users in your account, are specific to Amazon SageMaker:

- **AmazonSageMakerFullAccess** – Grants full access to Amazon SageMaker resources and the supported operations. This does not provide unrestricted Amazon S3 access, but supports buckets and objects with specific `sagemaker` tags.
- **AmazonSageMakerReadOnly** – Grants read-only access to Amazon SageMaker resources.

The following Amazon managed policies can be attached to users in your account but are not recommended:

- **AdministratorAccess** – Grants all actions for all Amazon services and for all resources in the account.
- **DataScientist** – Grants a wide range of permissions to cover most of the use cases (primarily for analytics and business intelligence) encountered by data scientists.

You can review these permissions policies by signing in to the IAM console and searching for them.

You can also create your own custom IAM policies to allow permissions for Amazon SageMaker actions and resources as you need them. You can attach these custom policies to the IAM users or groups that require them.

### Topics

- [AmazonSageMakerFullAccess \(p. 2465\)](#)
- [AmazonSageMakerReadOnly \(p. 2473\)](#)

- [SageMaker Updates to Amazon Managed Policies \(p. 2474\)](#)

## AmazonSageMakerFullAccess

This policy grants administrative permissions that allow a principal full access to all Amazon SageMaker resources and operations. The policy also provides select access to related services.

### Permissions details

This policy includes the following permissions.

- `application-autoscaling` – Allows principals to automatically scale a SageMaker real-time inference endpoint.
- `athena` – Allows principals to query a list of data catalogs, databases, and table metadata from Amazon Athena.
- `aws-marketplace` – Allows principals to view Amazon AI Marketplace subscriptions. You need this if you want to access SageMaker software subscribed in Amazon Web Services Marketplace.
- `cloudformation` – Allows principals to get Amazon CloudFormation templates for using SageMaker JumpStart solutions and Pipelines. SageMaker JumpStart creates resources necessary to run end-to-end machine learning solutions that tie SageMaker to other Amazon services. SageMaker Pipelines creates new projects that are backed by Amazon Service Catalog.
- `cloudwatch` – Allows principals to post CloudWatch metrics, interact with alarms, and upload logs to CloudWatch Logs in your account.
- `codebuild` – Allows principals to store Amazon CodeBuild artifacts for SageMaker Pipeline and Projects.
- `codemcommit` – Needed for Amazon CodeCommit integration with SageMaker notebook instances.
- `cognito-idp` – Needed for Amazon SageMaker Ground Truth to define private workforce and work teams.
- `ec2` – Needed for SageMaker to manage Amazon EC2 resources and network interfaces when you specify an Amazon VPC for your SageMaker jobs, models, endpoints, and notebook instances.
- `ecr` – Needed to pull and store Docker artifacts for Amazon SageMaker Studio (custom images), training, processing, batch inference, and inference endpoints. This is also required to use your own container in SageMaker. Additional permissions for SageMaker JumpStart solutions are required to create and remove custom images on behalf of users.
- `elastic-inference` – Allows principals to connect to Amazon Elastic Inference for using SageMaker notebook instances and endpoints.
- `elasticfilesystem` – Allows principals to access Amazon Elastic File System. This is needed for SageMaker to use data sources in Amazon Elastic File System for training machine learning models.
- `fsx` – Allows principals to access Amazon FSx. This is needed for SageMaker to use data sources in Amazon FSx for training machine learning models.
- `glue` – Needed for inference pipeline pre-processing from within SageMaker notebook instances.
- `groundtruthlabeling` – Needed for Ground Truth labeling jobs. The `groundtruthlabeling` endpoint is accessed by the Ground Truth console.
- `iam` – Needed to give the SageMaker console access to available IAM roles and create service-linked roles.
- `kms` – Needed to give the SageMaker console access to available Amazon KMS keys and retrieve them for any specified Amazon KMS aliases in jobs and endpoints.
- `lambda` – Allows principals to invoke and get a list of Amazon Lambda functions.
- `logs` – Needed to allow SageMaker jobs and endpoints to publish log streams.
- `redshift` – Allows principals to access Amazon Redshift cluster credentials.
- `redshift-data` – Allows principals to use data from Amazon Redshift to run, describe, and cancel statements; get statement results; and list schemas and tables.

- **robomaker** – Allows principals to have full access to create, get descriptions, and delete Amazon Robomaker simulation applications and jobs. This is also needed to run reinforcement learning examples on notebook instances.
- **s3** – Allows principals to have full access to Amazon S3 resources pertaining to SageMaker, but not all of Amazon S3.
- **secretsmanager** – Allows principals to have full access to Amazon Secrets Manager. The principals can securely encrypt, store, and retrieve credentials for databases and other services. This is also needed for SageMaker notebook instances with SageMaker code repositories that use GitHub.
- **servicecatalog** – Allows principals to use Amazon Service Catalog. The principals can create, get a list of, update, or terminate provisioned products, such as servers, databases, websites, or applications deployed using Amazon resources. This is needed for SageMaker JumpStart and Projects to find and read service catalog products and launch Amazon resources in user accounts.
- **sns** – Allows principals to get a list of Amazon SNS topics.
- **states** – Needed for SageMaker JumpStart and Pipelines to use a service catalog to create step function resources.
- **tag** – Needed for SageMaker Pipelines to render in Studio. Studio needs resources tagged with particular `sagemaker:project-id` tag-key. This requires the `tag:GetResources` permission.

## AmazonSageMakerReadOnly

This policy provides read-only access to SageMaker via the Amazon Web Services Management Console and SDK.

### Permissions details

This policy includes the following permissions.

- `application-autoscaling` – Allows users to browse descriptions of scalable SageMaker real-time inference endpoints.
- `aws-marketplace` – Allows users to view Amazon AI Marketplace subscriptions.
- `cloudwatch` – Allows users to receive CloudWatch alarms.
- `cognito-idp` – Needed for Amazon SageMaker Ground Truth to browse descriptions and lists of private workforce and work teams.
- `ecr` – Needed to read Docker artifacts for training and inference.

## SageMaker Updates to Amazon Managed Policies

View details about updates to Amazon managed policies for SageMaker since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the [SageMaker document history](#) page.

Change	Description	Date
AmazonSageMakerReadOnly updates – Update to an existing policy	New API <code>BatchGetRecord</code> added for SageMaker Feature Store.	JUNE 10, 2021
SageMaker started tracking changes	SageMaker started tracking changes for its Amazon managed policies.	JUNE 01, 2021

## Amazon SageMaker API Permissions: Actions, Permissions, and Resources Reference

When you are setting up access control and writing a permissions policy that you can attach to an IAM identity (an identity-based policy), use the following as a reference. For each Amazon SageMaker API operation, the corresponding actions for which you can grant permissions to perform the action, and the Amazon resource for which you can grant the permissions. You specify the actions in the policy's `Action` field, and you specify the resource value in the policy's `Resource` field.

**Note**

Except for the `ListTags` API, resource-level restrictions are not available on `List-` calls. Any user calling a `List-` API will see all resources of that type in the account.

To express conditions in your Amazon SageMaker policies, you can use Amazon-wide condition keys. For a complete list of Amazon-wide keys, see [Available Keys](#) in the *IAM User Guide*.

## Amazon SageMaker API Operations and Required Permissions for Actions

Amazon SageMaker API Operations	Required Permissions (API Actions)	Resources
AddTags	sagemaker:AddTags	arn:aws:sagemaker: <i>region:account-id</i> :*
CreateAutoMLJob	sagemaker:CreateAutoMLJob iam:PassRole  The following permission is required only if the associated ResourceConfig has a specified VolumeKmsKeyId and the associated role does not have a policy that permits this action:  kms:CreateGrant	arn:aws:sagemaker: <i>region:account-id:automl-job/autoMLJobName</i>
CreateDomain	sagemaker:CreateDomain iam:CreateServiceLinkedRole iam:PassRole  Required if a KMS customer managed CMK is specified for KmsKeyId:  elasticfilesystem>CreateFileSystem  kms:CreateGrant  kms:Decrypt  kms:DescribeKey  kms:GenerateDataKeyWithoutPlainText	arn:aws:sagemaker: <i>region:account-id:domain/domain-id</i>
CreateEndpoint	sagemaker:CreateEndpoint  kms:CreateGrant (required only if the associated EndPointConfig has a KmsKeyId specified)	arn:aws:sagemaker: <i>region:account-id:endpoint/endpointName</i>  arn:aws:sagemaker: <i>region:account-id:endpoint-config/endpointConfigName</i>
CreateEndpointConfig	sagemaker:CreateEndpointConfig	arn:aws:sagemaker: <i>region:account-id:endpoint-config/endpointConfigName</i>
CreateFlowDefinition	sagemaker:CreateFlowDefinition  iam:PassRole	arn:aws:sagemaker: <i>region:account-id:flow-definition/flowDefinitionName</i>
CreateHumanTaskUi	sagemaker:CreateHumanTaskUi	arn:aws:sagemaker: <i>region:account-id:human-task-ui/humanTaskUiName</i>

Amazon SageMaker API Operations	Required Permissions (API Actions)	Resources
CreateHyperParameter	sagemaker:CreateHyperParameter iam:PassRole  The following permission is required only if any of the associated ResourceConfig have a specified VolumeKmsKeyId and the associated role does not have a policy that permits this action:  kms:CreateGrant	arn:aws:sagemaker:region:account-id:hyper-parameter-tuning-job/ <i>hyperParameterTuningJobName</i>
CreateImage	sagemaker:CreateImage iam:PassRole	arn:aws:sagemaker:region:account-id:image/*
CreateImageVersion	sagemaker:CreateImageVersion	arn:aws:sagemaker:region:account-id:image-version/ <i>imageName</i> /*
CreateLabelingJob	sagemaker:CreateLabelingJob iam:PassRole	arn:aws:sagemaker:region:account-id:labeling-job/ <i>labelingJobName</i>
CreateModel	sagemaker:CreateModel iam:PassRole	arn:aws:sagemaker:region:account-id:model/ <i>modelName</i>

Amazon SageMaker API Operations	Required Permissions (API Actions)	Resources
<a href="#">CreateNotebookInstance</a>	<p>sagemaker:CreateNotebookInstance iam:PassRole</p> <p>The following permissions are required only if you specify a VPC for your notebook instance:</p> <ul style="list-style-type: none"> <li>ec2:CreateNetworkInterface</li> <li>ec2:DescribeSecurityGroups</li> <li>ec2:DescribeSubnets</li> <li>ec2:DescribeVpcs</li> </ul> <p>The following permission is required only if you specify a VPC and an elastic inference accelerator for your notebook instance:</p> <ul style="list-style-type: none"> <li>ec2:DescribeVpcEndpoints</li> </ul> <p>The following permissions are required only if you specify an encryption key:</p> <ul style="list-style-type: none"> <li>kms:DescribeKey</li> <li>kms&gt;CreateGrant</li> </ul> <p>The following permission is required only if you specify an Amazon Secrets Manager secret to access a private Git repository:</p> <ul style="list-style-type: none"> <li>secretsmanager:GetSecretValue</li> </ul>	arn:aws:sagemaker: <i>region:account-id:notebook-instance/notebookInstanceName</i>
<a href="#">CreatePresignedNotebookInstanceUrl</a>	sagemaker:CreatePresignedNotebookInstanceUrl	arn:aws:sagemaker: <i>region:account-id:notebook-instance/notebookInstanceName</i>
<a href="#">CreateProcessingJob</a>	<p>sagemaker:CreateProcessingJob iam:PassRole</p> <p>kms:CreateGrant (required only if the associated ProcessingResources has a specified VolumeKmsKeyId and the associated role does not have a policy that permits this action)</p>	arn:aws:sagemaker: <i>region:account-id:processing-job/processingJobName</i>

Amazon SageMaker API Operations	Required Permissions (API Actions)	Resources
<a href="#">CreateTrainingJob</a>	sagemaker:CreateTrainingJob  iam:PassRole  kms:CreateGrant (required only if the associated ResourceConfig has a specified VolumeKmsKeyId and the associated role does not have a policy that permits this action)	arn:aws:sagemaker: <i>region:account-id:training-job/trainingJobName</i>
<a href="#">CreateTransformJob</a>	sagemaker:CreateTransformJob  kms:CreateGrant (required only if the associated TransformResources has a specified VolumeKmsKeyId and the associated role does not have a policy that permits this action)	arn:aws:sagemaker: <i>region:account-id:transform-job/transformJobName</i>

## Troubleshooting Amazon SageMaker Identity and Access

Use the following information to help you diagnose and fix common issues that you might encounter when working with SageMaker and IAM.

## Topics

- [I Am Not Authorized to Perform an Action in SageMaker \(p. 2488\)](#)
- [I Am Not Authorized to Perform iam:PassRole \(p. 2488\)](#)
- [I Want to View My Access Keys \(p. 2488\)](#)
- [I'm an Administrator and Want to Allow Others to Access SageMaker \(p. 2489\)](#)
- [I Want to Allow People Outside of My Amazon Account to Access My SageMaker Resources \(p. 2489\)](#)

## I Am Not Authorized to Perform an Action in SageMaker

If the Amazon Web Services Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the `mateojackson` IAM user tries to use the console to view details about a training job but does not have `sagemaker:DescribeTrainingJob` permissions.

```
User: arn:aws-cn:iam::123456789012:user/mateojackson is not
      authorized to perform: sagemaker:DescribeTrainingJob on resource: my-example-
      widget
```

In this case, Mateo asks his administrator to update his policies to allow him to access the `TrainingJob` resource using the `sagemaker:DescribeTrainingJob` action.

## I Am Not Authorized to Perform iam:PassRole

If you receive an error that you're not authorized to perform the `iam:PassRole` action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password. Ask that person to update your policies to allow you to pass a role to SageMaker.

Some Amazon services allow you to pass an existing role to that service, instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named `marymajor` tries to use the console to perform an action in SageMaker. However, the action requires the service to have permissions granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws-cn:iam::123456789012:user/marymajor is not authorized to perform:
      iam:PassRole
```

In this case, Mary asks her administrator to update her policies to allow her to perform the `iam:PassRole` action.

## I Want to View My Access Keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, `AKIAIOSFODNN7EXAMPLE`) and a secret access key (for example, `wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY`). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

**Important**

Do not provide your access keys to a third party, even to help [find your canonical user ID](#). By doing this, you might give someone permanent access to your account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see [Managing access keys](#) in the *IAM User Guide*.

## I'm an Administrator and Want to Allow Others to Access SageMaker

To allow others to access SageMaker, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access Amazon. You must then attach a policy to the entity that grants them the correct permissions in SageMaker.

To get started right away, see [Creating your first IAM delegated user and group](#) in the *IAM User Guide*.

## I Want to Allow People Outside of My Amazon Account to Access My SageMaker Resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether SageMaker supports these features, see [How Amazon SageMaker Works with IAM \(p. 2421\)](#).
- To learn how to provide access to your resources across Amazon accounts that you own, see [Providing access to an IAM user in another Amazon account that you own](#) in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party Amazon accounts, see [Providing access to Amazon accounts owned by third parties](#) in the *IAM User Guide*.
- To learn how to provide access through identity federation, see [Providing access to externally authenticated users \(identity federation\)](#) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see [How IAM roles differ from resource-based policies](#) in the *IAM User Guide*.

## Logging and Monitoring

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. You can also set alarms that watch for certain thresholds and send notifications or take actions when those thresholds are met. For more information, see [Monitor Amazon SageMaker with Amazon CloudWatch \(p. 2523\)](#).

Amazon CloudWatch Logs enables you to monitor, store, and access your log files from Amazon EC2 instances, Amazon CloudTrail, and other sources. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold

that you specify. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see [Log Amazon SageMaker Events with Amazon CloudWatch \(p. 2534\)](#).

Amazon CloudTrail provides a record of actions taken by a user, role, or an Amazon service in SageMaker. Using the information collected by CloudTrail, you can determine the request that was made to SageMaker, the IP address from which the request was made, who made the request, when it was made, and additional details. For more information, [Log Amazon SageMaker API Calls with Amazon CloudTrail \(p. 2535\)](#).

**Note**

CloudTrail does not monitor calls to [`runtime\_InvokeEndpoint`](#).

You can create rules in Amazon CloudWatch Events to react to status changes in status in a SageMaker training, hyperparameter tuning, or batch transform job. For more information, see [Automating Amazon SageMaker with Amazon EventBridge \(p. 2537\)](#).

## Compliance Validation for Amazon SageMaker

Third-party auditors assess the security and compliance of Amazon SageMaker as part of multiple Amazon compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of Amazon services in scope of specific compliance programs, see [Amazon Services in Scope by Compliance Program](#). For general information, see [Amazon Compliance Programs](#).

You can download third-party audit reports using Amazon Artifact. For more information, see [Downloading Reports in Amazon Artifact](#).

Your compliance responsibility when using Amazon SageMaker is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. Amazon provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on Amazon.
- [Architecting for HIPAA Security and Compliance Whitepaper](#) – This whitepaper describes how companies can use Amazon to create HIPAA-compliant applications.
- [Amazon Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.
- [Amazon Config](#) – This Amazon service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [Amazon Security Hub](#) – This Amazon service provides a comprehensive view of your security state within Amazon that helps you check your compliance with security industry standards and best practices.

## Resilience in Amazon SageMaker

The Amazon global infrastructure is built around Amazon Regions and Availability Zones. Amazon Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between Availability Zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about Amazon Regions and Availability Zones, see [Amazon Global Infrastructure](#).

In addition to the Amazon global infrastructure, Amazon SageMaker offers several features to help support your data resiliency and backup needs.

## Infrastructure Security in Amazon SageMaker

As a managed service, Amazon SageMaker is protected by the Amazon global network security procedures that are described in the [Amazon Web Services: Overview of Security Processes](#) whitepaper.

You use Amazon published API calls to access Amazon SageMaker through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [Amazon Security Token Service](#) (Amazon STS) to generate temporary security credentials to sign requests.

## Connect SageMaker Studio Notebooks to Resources in a VPC

Amazon SageMaker Studio allows direct internet access by default. This could provide an avenue for unauthorized access to your data. For example, if you install malicious code on your computer (in the form of a publicly available notebook or a publicly available source code library), it could access your data. You can choose to restrict which traffic can access the internet by launching Studio in a Virtual Private Cloud (VPC) of your choosing. This allows you fine-grained control of the network access and internet connectivity of your SageMaker Studio notebooks. You can disable direct internet access to add an additional layer of security.

By default, SageMaker Studio provides a network interface that allows communication with the internet through a VPC managed by SageMaker. Traffic to Amazon services like Amazon S3 and CloudWatch goes through an internet gateway as does traffic that accesses the SageMaker API and SageMaker runtime. Traffic between the domain and your Amazon EFS volume goes through the VPC that you specified when you onboarded to Studio or called the [CreateDomain](#) API. The following diagram shows the default configuration.

To disable direct internet access, you can specify the VPC-only network access type when you onboard to Studio or call the [CreateDomain](#) API. Doing so prevents SageMaker from providing internet access to your Studio notebooks. As a result, you won't be able to run a Studio notebook unless your VPC has an interface endpoint to the SageMaker API and runtime, or a NAT gateway with internet access, and your security groups allow outbound connections. The following diagram shows a configuration for using VPC-only mode.

### VPC requirements in VpcOnly

When you choose `VpcOnly`, your VPC must contain the following:

- Subnets with one IP address for each instance. For more information, see [VPC and subnet sizing for IPv4](#).

#### Note

You can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see [Dedicated Instances](#).

- One or more security groups with inbound and outbound rules that together allow the following traffic:

- NFS traffic over TCP on port 2049 between the domain and the Amazon EFS volume.
- TCP traffic within the security group. This is required for connectivity between the JupyterServer app and the KernelGateway apps.
- If you want to allow internet access, you must use NAT gateway with access to internet (for example, via an internet gateway).
- If you don't want to allow internet access, you must create interface VPC endpoints (Amazon PrivateLink) to access the following:
  - The SageMaker API and SageMaker runtime. This is required to run Studio notebooks and to train and host models.
  - Amazon S3 and other Amazon services you require.
  - If you're using SageMaker Projects in SageMaker Studio without internet access, you need a VPC endpoint for Service Catalog.

You must associate the security groups for your VPC with these endpoints.

**Note**

For a customer working within VPC mode, company firewalls can cause connection issues with SageMaker Studio or between JupyterServer and the KernelGateway. Make the following checks if you encounter one of these issues when using SageMaker Studio from behind a firewall.

- Check that the Studio URL is in your networks allowlist.
- Check that the websocket connections are not blocked. Jupyter uses websocket under the hood. If the KernelGateway application is InService, JupyterServer may not be able to connect to the KernelGateway. You should see this problem when opening System Terminal as well.

**For more information**

- [Securing Amazon SageMaker Studio connectivity using a private VPC](#).
- [Security groups for your VPC](#)
- [Connect to SageMaker Through a VPC Interface Endpoint \(p. 2495\)](#)
- [VPC with public and private subnets \(NAT\)](#)

## Connect a Notebook Instance to Resources in a VPC

SageMaker notebook instances are internet-enabled by default. This allows you to download popular packages and notebooks, customize your development environment, and work efficiently. However, this could provide an additional avenue for unauthorized access to your data. For example, a malicious user or code that you accidentally install on the computer (in the form of a publicly available notebook or a publicly available source code library) could access your data. You can choose to launch your notebook instance in your Virtual Private Cloud (VPC) to restrict which traffic can go through the public Internet. When launched with your VPC attached, the notebook instance can either be configured with or without direct internet access.

When your notebook allows *direct internet access*, SageMaker provides a network interface that allows the notebook to communicate with the internet through a VPC managed by SageMaker. Traffic within your VPC's CIDR goes through elastic network interface created in your VPC. All the other traffic goes through the network interface created by SageMaker, which is essentially through the public internet. Traffic to gateway VPC endpoints like Amazon S3 and DynamoDB goes through the public internet, while traffic to interface VPC endpoints (interface endpoints) still goes through your VPC. If you want to use gateway VPC endpoints, you might want to disable direct internet access.

To disable direct internet access, you can specify a VPC for your notebook instance. By doing so, you prevent SageMaker from providing internet access to your notebook instance. As a result, the notebook

instance won't be able to train or host models unless your VPC has an interface endpoint (PrivateLink) or a NAT gateway, and your security groups allow outbound connections.

For information about creating a VPC interface endpoint to use Amazon PrivateLink for your notebook instance, see [Connect to a Notebook Instance Through a VPC Interface Endpoint \(p. 2497\)](#). For information about setting up a NAT gateway for your VPC, see [VPC with Public and Private Subnets \(NAT\)](#) in the *Amazon Virtual Private Cloud User Guide*. For information about security groups, see [Security Groups for Your VPC](#). For more information about networking configurations in each networking mode and configuring network on premise, see [Understanding Amazon SageMaker notebook instance networking configurations and advanced routing options](#).

## Security and Shared Notebook Instances

A SageMaker notebook instance is designed to work best for an individual user. It is designed to give data scientists and other users the most power for managing their development environment.

A notebook instance user has root access for installing packages and other pertinent software. We recommend that you exercise judgement when granting individuals access to notebook instances that are attached to a VPC that contains sensitive information. For example, you might grant a user access to a notebook instance with an IAM policy, as shown in the following example:

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": "sagemaker>CreatePresignedNotebookInstanceUrl",  
            "Resource": "arn:aws:sagemaker:region:account-id:notebook-instance/  
myNotebookInstance"  
        }  
    ]  
}
```

## Training and Inference Containers Run in Internet-Free Mode

SageMaker training and deployed inference containers are internet-enabled by default. This allows containers to access external services and resources on the public internet as part of your training and inference workloads. However, this could provide an avenue for unauthorized access to your data. For example, a malicious user or code that you accidentally install on the container (in the form of a publicly available source code library) could access your data and transfer it to a remote host.

If you use an Amazon VPC by specifying a value for the `VpcConfig` parameter when you call `CreateTrainingJob`, `CreateHyperParameterTuningJob`, or `CreateModel`, you can protect your data and resources by managing security groups and restricting internet access from your VPC. However, this comes at the cost of additional network configuration, and has the risk of configuring your network incorrectly. If you do not want SageMaker to provide external network access to your training or inference containers, you can enable network isolation when you create your training job or model by setting the value of the `EnableNetworkIsolation` parameter to `True` when you call `CreateTrainingJob`, `CreateHyperParameterTuningJob`, or `CreateModel`.

If you enable network isolation, the containers can't make any outbound network calls, even to other Amazon services such as Amazon S3. Additionally, no Amazon credentials are made available to the container runtime environment. In the case of a training job with multiple instances, network inbound and outbound traffic is limited to the peers of each training container. SageMaker still performs download and upload operations against Amazon S3 using your SageMaker execution role in isolation from the training or inference container.

Network isolation is required for training jobs and models run using resources from Amazon Web Services Marketplace. Network isolation can be used in conjunction with a VPC. In this scenario, download and upload of customer data and model artifacts are routed via your VPC subnet. However, the training and inference containers themselves continue to be isolated from the network, and do not have access to any resource within your VPC or on the internet.

Network isolation is not supported by the following managed SageMaker containers as they require access to Amazon S3:

- Chainer
- PyTorch
- Scikit-learn
- SageMaker Reinforcement Learning

## SageMaker Scans Amazon Web Services Marketplace Training and Inference Containers for Security Vulnerabilities

To meet our security requirements, algorithms and model packages listed in Amazon Web Services Marketplace are scanned for Common Vulnerabilities and Exposures (CVE). CVE is a list of publicly known information about security vulnerability and exposure. The National Vulnerability Database (NVD) provides CVE details such as severity, impact rating, and fix information. Both CVE and NVD are available for public consumption and free for security tools and services to use. For more information, see [http://cve.mitre.org/about/faqs.html#what\\_is\\_cve](http://cve.mitre.org/about/faqs.html#what_is_cve).

## Connect to SageMaker Through a VPC Interface Endpoint

You can connect directly to the SageMaker API or to the SageMaker Runtime through an [interface endpoint](#) in your Virtual Private Cloud (VPC) instead of connecting over the public internet. When you use a VPC interface endpoint, communication between your VPC and the SageMaker API or Runtime is conducted entirely and securely within the Amazon network.

The SageMaker API and Runtime support [Amazon Virtual Private Cloud](#) (Amazon VPC) interface endpoints that are powered by [Amazon PrivateLink](#). Each VPC endpoint is represented by one or more [Elastic Network Interfaces](#) with private IP addresses in your VPC subnets.

The VPC interface endpoint connects your VPC directly to the SageMaker API or Runtime without an internet gateway, NAT device, VPN connection, or Amazon Direct Connect connection. The instances in your VPC don't need public IP addresses to communicate with the SageMaker API or Runtime.

You can create an interface endpoint to connect to SageMaker or to SageMaker Runtime with either the Amazon console or Amazon Command Line Interface (Amazon CLI) commands. For instructions, see [Creating an Interface Endpoint](#).

*After you have created a VPC endpoint, you can use the following example CLI commands that use the endpoint-url parameter to specify interface endpoints to the SageMaker API or Runtime:*

```
aws sagemaker list-notebook-instances --endpoint-
url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com

aws sagemaker list-training-jobs --endpoint-
url VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
```

```
aws sagemaker-runtime invoke-endpoint --endpoint-
url VPC_Endpoint_ID.runtime.sagemaker.Region.vpce.amazonaws.com \
--endpoint-name Endpoint_Name \
--body "Endpoint_Body" \
--content-type "Content_Type" \
Output_File
```

If you enable private DNS hostnames for your VPC endpoint, you don't need to specify the endpoint URL. The SageMaker API DNS hostname that the CLI and SageMaker SDK use by default ([https://api.sagemaker.\*\*Region\*\*.amazonaws.com](https://api.sagemaker.<b>Region</b>.amazonaws.com)) resolves to your VPC endpoint. Similarly, the SageMaker Runtime DNS hostname that the CLI and SageMaker Runtime SDK use by default ([https://runtime.sagemaker.\*\*Region\*\*.amazonaws.com](https://runtime.sagemaker.<b>Region</b>.amazonaws.com)) resolves to your VPC endpoint.

The SageMaker API and Runtime support VPC endpoints in all Amazon Regions where both [Amazon VPC](#) and [SageMaker](#) are available. SageMaker supports making calls to all of its [Operations](#) inside your VPC. The result `AuthorizedUrl` from the `CreatePresignedNotebookInstanceUrl` is not supported by Private Link. For information about how to enable PrivateLink for the authorized URL that users use to connect to a notebook instance, see [Connect to a Notebook Instance Through a VPC Interface Endpoint \(p. 2497\)](#).

To learn more about Amazon PrivateLink, see the [Amazon PrivateLink documentation](#). Refer to [VPC Pricing](#) for the price of VPC Endpoints. To learn more about VPC and Endpoints, see [Amazon VPC](#). For information about how to use identity-based Amazon Identity and Access Management policies to restrict access to the SageMaker API and runtime, see [Control Access to the SageMaker API by Using Identity-based Policies \(p. 2441\)](#).

## Create a VPC Endpoint Policy for SageMaker

You can create a policy for Amazon VPC endpoints for SageMaker to specify the following:

- The principal that can perform actions.
- The actions that can be performed.
- The resources on which actions can be performed.

For more information, see [Controlling Access to Services with VPC Endpoints](#) in the *Amazon VPC User Guide*.

### Note

VPC endpoint policies aren't supported for Federal Information Processing Standard (FIPS) SageMaker runtime endpoints for `runtime_InvokeEndpoint`.

The following example VPC endpoint policy specifies that all users who have access to the VPC interface endpoint are allowed to invoke the SageMaker hosted endpoint named `myEndpoint`.

```
{
  "Statement": [
    {
      "Action": "sagemaker:InvokeEndpoint",
      "Effect": "Allow",
      "Resource": "arn:aws:sagemaker:us-west-2:123456789012:endpoint/myEndpoint",
      "Principal": "*"
    }
  ]
}
```

In this example, the following are denied:

- Other SageMaker API actions, such as `sagemaker:CreateEndpoint` and `sagemaker:CreateTrainingJob`.

- Invoking SageMaker hosted endpoints other than `myEndpoint`.

**Note**

In this example, users can still take other SageMaker API actions from outside the VPC. For information about how to restrict API calls to those from within the VPC, see [Control Access to the SageMaker API by Using Identity-based Policies \(p. 2441\)](#).

## Create a VPC Endpoint Policy for SageMaker Feature Store

To create a VPC Endpoint for Feature Store, use the following endpoint template substituting your `VPC_Endpoint_ID.api` and `Region`:

`VPC_Endpoint_ID.api.featurestore-runtime.sagemaker.Region.vpce.amazonaws.com`

## Connect to a Notebook Instance Through a VPC Interface Endpoint

You can connect to your notebook instance from your VPC through an [interface endpoint](#) in your Virtual Private Cloud (VPC) instead of connecting over the public internet. When you use a VPC interface endpoint, communication between your VPC and the notebook instance is conducted entirely and securely within the Amazon network.

SageMaker notebook instances support [Amazon Virtual Private Cloud](#) (Amazon VPC) interface endpoints that are powered by [Amazon PrivateLink](#). Each VPC endpoint is represented by one or more [Elastic Network Interfaces](#) with private IP addresses in your VPC subnets.

**Note**

Before you create an interface VPC endpoint to connect to a notebook instance, create an interface VPC endpoint to connect to the SageMaker API. That way, when users call `CreatePresignedNotebookInstanceUrl` to get the URL to connect to the notebook instance, that call also goes through the interface VPC endpoint. For information, see [Connect to SageMaker Through a VPC Interface Endpoint \(p. 2495\)](#).

You can create an interface endpoint to connect to your notebook instance with either the Amazon console or Amazon Command Line Interface (Amazon CLI) commands. For instructions, see [Creating an Interface Endpoint](#). Make sure that you create an interface endpoint for all of the subnets in your VPC from which you want to connect to the notebook instance.

When you create the interface endpoint, specify `aws.sagemaker.region.notebook` as the service name. After you create a VPC endpoint, enable private DNS for your VPC endpoint. Anyone using the SageMaker API, the Amazon CLI, or the console to connect to the notebook instance from within the VPC will connect to the notebook instance through the VPC endpoint instead of the public internet.

SageMaker notebook instances support VPC endpoints in all Amazon Regions where both [Amazon VPC](#) and [SageMaker](#) are available.

### Topics

- [Connect Your Private Network to Your VPC \(p. 2497\)](#)
- [Create a VPC Endpoint Policy for SageMaker Notebook Instances \(p. 2498\)](#)
- [Restrict Access to Connections from Within Your VPC \(p. 2498\)](#)

## Connect Your Private Network to Your VPC

To connect to your notebook instance through your VPC, you either have to connect from an instance that is inside the VPC, or connect your private network to your VPC by using an Amazon Virtual Private

Network (VPN) or Amazon Direct Connect. For information about Amazon VPN, see [VPN Connections in the \*Amazon Virtual Private Cloud User Guide\*](#). For information about Amazon Direct Connect, see [Creating a Connection in the \*Amazon Direct Connect User Guide\*](#).

## Create a VPC Endpoint Policy for SageMaker Notebook Instances

You can create a policy for Amazon VPC endpoints for SageMaker notebook instances to specify the following:

- The principal that can perform actions.
  - The actions that can be performed.
  - The resources on which actions can be performed.

For more information, see [Controlling Access to Services with VPC Endpoints](#) in the *Amazon VPC User Guide*.

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the notebook instance named `myNotebookInstance`.

```
{  
    "Statement": [  
        {  
            "Action": "sagemaker>CreatePresignedNotebookInstanceUrl",  
            "Effect": "Allow",  
            "Resource": "arn:aws:sagemaker:us-west-2:123456789012:notebook-instance/  
myNotebookInstance",  
            "Principal": "*"  
        }  
    ]  
}
```

Access to other notebook instances is denied.

## Restrict Access to Connections from Within Your VPC

Even if you set up an interface endpoint in your VPC, individuals outside the VPC can connect to the notebook instance over the internet.

## **Important**

If you apply an IAM policy similar to one of the following, users can't access the specified SageMaker APIs or the notebook instance through the console.

To restrict access to only connections made from within your VPC, create an Amazon Identity and Access Management policy that restricts access to only calls that come from within your VPC. Then add that policy to every Amazon Identity and Access Management user, group, or role used to access the notebook instance.

## Note

**Note** This policy allows connections only to callers within a subnet where you created an interface endpoint.

```
{
    "Id": "notebook-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable Notebook Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreatePresignedNotebookInstanceUrl"
            ],
            "Resource": [
                "arn:aws:sagemaker:::notebook-instance/*"
            ]
        }
    ]
}
```

```

        "sagemaker:DescribeNotebookInstance"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "aws:SourceVpc": "vpc-111bbaaa"
        }
    }
}
]
}
}

```

If you want to restrict access to the notebook instance to only connections made using the interface endpoint, use the `aws:SourceVpce` condition key instead of `aws:SourceVpc`:

```

{
    "Id": "notebook-example-1",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable Notebook Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreatePresignedNotebookInstanceUrl",
                "sagemaker:DescribeNotebookInstance"
            ],
            "Resource": "*",
            "Condition": {
                "ForAnyValue:StringEquals": {
                    "aws:sourceVpce": [
                        "vpce-111bbccc",
                        "vpce-111bbddd"
                    ]
                }
            }
        }
    ]
}

```

Both of these policy examples assume that you have also created an interface endpoint for the SageMaker API. For more information, see [Connect to SageMaker Through a VPC Interface Endpoint \(p. 2495\)](#). In the second example, one of the values for `aws:SourceVpce` is the ID of the interface endpoint for the notebook instance. The other is the ID of the interface endpoint for the SageMaker API.

The policy examples here include `DescribeNotebookInstance` because typically you would call `DescribeNotebookInstance` to make sure that the `NotebookInstanceStatus` is `InService` before you try to connect to it. For example:

```

aws sagemaker describe-notebook-instance \
    --notebook-instance-name myNotebookInstance

{
    "NotebookInstanceArn": "arn:aws:sagemaker:us-west-2:1234567890ab:notebook-instance/mynotebookinstance",
    "NotebookInstanceName": "myNotebookInstance",
    "NotebookInstanceStatus": "InService",
    "Url": "mynotebookinstance.notebook.us-west-2.sagemaker.aws",
    "InstanceType": "ml.m4.xlarge",
    "RoleArn": "

```

```
"arn:aws:iam::1234567890ab:role/service-role/AmazonSageMaker-  
ExecutionRole-12345678T123456",  
    "LastModifiedTime": 1540334777.501,  
    "CreationTime": 1523050674.078,  
    "DirectInternetAccess": "Disabled"  
}  
aws sagemaker create-presigned-notebook-instance-url --notebook-instance-name  
myNotebookInstance  
  
{  
    "AuthorizedUrl": "https://mynotebookinstance.notebook.us-west-2.sagemaker.aws?  
authToken=AuthToken  
}
```

For both of these calls, if you did not enable private DNS hostnames for your VPC endpoint, or if you are using a version of the Amazon SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the call to `create-presigned-notebook-instance-url` would be:

```
aws sagemaker create-presigned-notebook-instance-url  
--notebook-instance-name myNotebookInstance --endpoint-url  
VPC_Endpoint_ID.api.sagemaker.Region.vpce.amazonaws.com
```

## Connect Your Private Network to Your VPC

To call the SageMaker API and runtime through your VPC, you have to connect from an instance that is inside the VPC or connect your private network to your VPC by using an Amazon Virtual Private Network (VPN) or Amazon Direct Connect. For information about Amazon VPN, see [VPN Connections](#) in the *Amazon Virtual Private Cloud User Guide*. For information about Amazon Direct Connect, see [Creating a Connection](#) in the *Amazon Direct Connect User Guide*.

## Connect to SageMaker Studio Through an Interface VPC Endpoint

You can connect to Amazon SageMaker Studio from your [Amazon Virtual Private Cloud](#) (Amazon VPC) through an [interface endpoint](#) in your VPC instead of connecting over the internet. When you use an interface VPC endpoint (interface endpoint), communication between your VPC and Studio is conducted entirely and securely within the Amazon network.

SageMaker Studio supports interface endpoints that are powered by [Amazon PrivateLink](#). Each interface endpoint is represented by one or more [Elastic network interfaces](#) with private IP addresses in your VPC subnets.

You can create an interface endpoint to connect to Studio with either the Amazon console or the Amazon Command Line Interface (Amazon CLI). For instructions, see [Creating an interface endpoint](#). Make sure that you create interface endpoints for all of the subnets in your VPC from which you want to connect to Studio.

When you create an interface endpoint, ensure that the security groups on your endpoint allow inbound access for HTTPS traffic from the security groups associated with SageMaker Studio. For more information, see [Control access to services with VPC endpoints](#).

### Note

In addition to creating an interface endpoint to connect to SageMaker Studio, create an interface endpoint to connect to the Amazon SageMaker API. When users call `CreatePresignedDomainUrl` to get the URL to connect to Studio, that call goes through the interface endpoint used to connect to the SageMaker API.

When you create the interface endpoint, specify `aws.sagemaker.Region.studio` as the service name. After you create the interface endpoint, enable private DNS for your endpoint. Anyone who uses the SageMaker API, the Amazon CLI, or the console to connect to SageMaker Studio from within the VPC will connect to Studio through the interface endpoint instead of the public internet. You also need to setup a custom DNS with Private Hosted Zones for the Amazon VPC endpoint so SageMaker Studio can access the SageMaker API using the `api.sagemaker.$region.amazonaws.com` endpoint rather than using the VPC Endpoint URL. For instructions on setting up a Private Hosted Zone, see [Working with private hosted zones](#).

Studio supports interface endpoints in all Amazon Regions where both [Amazon SageMaker](#) and [Amazon VPC](#) are available.

### Topics

- [Create a VPC Endpoint Policy for SageMaker Studio \(p. 2501\)](#)
- [Allow Access Only from Within Your VPC \(p. 2502\)](#)

## Create a VPC Endpoint Policy for SageMaker Studio

You can attach an Amazon VPC endpoint policy to the interface VPC endpoints that you use to connect to SageMaker Studio. The endpoint policy controls access to Studio. You can specify the following:

- The principal that can perform actions
- The actions that can be performed
- The resources on which actions can be performed

To use a VPC endpoint with SageMaker Studio, your endpoint policy must allow the `CreateApp` operation on the `KernelGateway` app type. This allows traffic that is routed to through the VPC endpoint to call the `CreateApp` API. The following example VPC endpoint policy shows how to allow the `CreateApp` operation.

```
{  
  "Statement": [  
    {  
      "Action": "sagemaker:CreateApp",  
      "Effect": "Allow",  
      "Resource": "arn:aws:sagemaker:us-west-2:acct-id:user-profile/domain-id/*",  
      "Principal": "*"  
    }  
  ]  
}
```

For more information, see [Controlling access to services with VPC endpoints](#).

The following example of a VPC endpoint policy specifies that all users that have access to the endpoint are allowed to access the user profiles in the SageMaker Studio domain with the specified domain ID. Access to other domains is denied.

```
{  
  "Statement": [  
    {  
      "Action": "sagemaker:CreatePresignedDomainUrl",  
      "Effect": "Allow",  
      "Resource": "arn:aws:sagemaker:us-west-2:acct-id:user-profile/domain-id/*",  
      "Principal": "*"  
    }  
  ]  
}
```

## Allow Access Only from Within Your VPC

Users outside your VPC can connect to SageMaker Studio over the internet even if you set up an interface endpoint in your VPC.

To allow access to only connections made from within your VPC, create an Amazon Identity and Access Management (IAM) policy to that effect. Add that policy to every IAM user, group, or role used to access Studio. This feature is only supported in IAM mode, and is not supported in SSO mode. The following examples demonstrate how to create such policies.

### Important

If you apply an IAM policy similar to one of the following examples, users can't access SageMaker Studio or the specified SageMaker APIs through the SageMaker console. To access Studio, users must use a presigned URL or call the SageMaker APIs directly.

#### Example 1

The following policy allows connections only to callers within the subnet where you created the interface endpoint.

```
{  
    "Id": "sagemaker-studio-example-1",  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "Enable SageMaker Studio Access",  
            "Effect": "Allow",  
            "Action": [  
                "sagemaker>CreatePresignedDomainUrl",  
                "sagemaker:DescribeUserProfile"  
            ],  
            "Resource": "*",  
            "Condition": {  
                "StringEquals": {  
                    "aws:SourceVpc": "vpc-111bbaaa"  
                }  
            }  
        }  
    ]  
}
```

#### Example 2

The following policy allows connections only to those made through the interface endpoints specified by the `aws:sourceVpc` condition key. For example, the first interface endpoint could allow access through the SageMaker Studio Control Panel. The second interface endpoint could allow access through the SageMaker API.

```
{  
    "Id": "sagemaker-studio-example-2",  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Sid": "Enable SageMaker Studio Access",  
            "Effect": "Allow",  
            "Action": [  
                "sagemaker>CreatePresignedDomainUrl",  
                "sagemaker:DescribeUserProfile"  
            ],  
            "Resource": "*",  
            "Condition": {  
                "ForAnyValue:StringEquals": {  
                    "aws:sourceVpc": "vpc-111bbaaa"  
                }  
            }  
        }  
    ]  
}
```

```

        "aws:sourceVpce": [
            "vpce-111bbccc",
            "vpce-111bbddd"
        ]
    }
}
]
}
}

```

This policy includes the `DescribeUserProfile` action. Typically you call `DescribeUserProfile` to make sure that the status of the user profile is `InService` before you try to connect to the domain. For example:

```
aws sagemaker describe-user-profile \
--domain-id domain-id \
--user-profile-name profile-name
```

**Response:**

```
{
    "DomainId": "domain-id",
    "UserProfileArn": "arn:aws:sagemaker:us-west-2:acct-id:user-profile/domain-id/profile-
name",
    "UserProfileName": "profile-name",
    "HomeEfsFileSystemUid": "200001",
    "Status": "InService",
    "LastModifiedTime": 1605418785.555,
    "CreationTime": 1605418477.297
}
```

```
aws sagemaker create-presigned-domain-url
--domain-id domain-id \
--user-profile-name profile-name
```

**Response:**

```
{
    "AuthorizedUrl": "https://domain-id.studio.us-west-2.sagemaker.aws/auth?
token=AuthToken"
}
```

For both of these calls, if you are using a version of the Amazon SDK that was released before August 13, 2018, you must specify the endpoint URL in the call. For example, the call to `create-presigned-domain-url` would be:

```
aws sagemaker create-presigned-domain-url
--domain-id domain-id \
--user-profile-name profile-name \
--endpoint-url vpc-endpoint-id.api.sagemaker.Region.vpce.amazonaws.com
```

### Example 3

The following policy allows connections only from the specified range of IP addresses using the `aws:SourceIp` condition key.

```
{
    "Id": "sagemaker-studio-example-3",
```

```
"Version": "2012-10-17",
"Statement": [
    {
        "Sid": "Enable SageMaker Studio Access",
        "Effect": "Allow",
        "Action": [
            "sagemaker>CreatePresignedDomainUrl",
            "sagemaker:DescribeUserProfile"
        ],
        "Resource": "*",
        "Condition": {
            "IpAddress": {
                "aws:SourceIp": [
                    "192.0.2.0/24",
                    "203.0.113.0/24"
                ]
            }
        }
    }
]
```

#### Example 4

If you are accessing SageMaker Studio through an interface endpoint, you can use the `aws:VpcSourceIp` condition key to allow connections only from the specified range of IP addresses as shown in the following policy.

```
{
    "Id": "sagemaker-studio-example-4",
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "Enable SageMaker Studio Access",
            "Effect": "Allow",
            "Action": [
                "sagemaker>CreatePresignedDomainUrl",
                "sagemaker:DescribeUserProfile"
            ],
            "Resource": "*",
            "Condition": {
                "IpAddress": {
                    "aws:VpcSourceIp": [
                        "192.0.2.0/24",
                        "203.0.113.0/24"
                    ]
                }
            }
        }
    ]
}
```

## Give SageMaker Compilation Jobs Access to Resources in Your Amazon VPC

SageMaker Neo runs compilation jobs in an Amazon Virtual Private Cloud by default. However, compilation jobs access Amazon resources—such as the Amazon Simple Storage Service (Amazon S3) buckets where you store model artifacts—over the internet.

To control access to your data, we recommend that you create a private VPC and configure it so that they aren't accessible over the internet. For information about creating and configuring a VPC, see

[Getting Started With Amazon VPC](#) in the *Amazon VPC User Guide*. Using a VPC helps to protect your data because you can configure your VPC so that it is not connected to the internet. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

You specify your private VPC configuration when you create compilation jobs by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates *elastic network interfaces* that are associated with your security groups in one of the subnets. Network interfaces allow SageMaker Neo's compilation jobs to connect to resources in your VPC. For information about network interfaces, see [Elastic Network Interfaces](#) in the *Amazon VPC User Guide*.

**Note**

For compilation jobs, you can configure only subnets with a default tenancy VPC in which your job runs on shared hardware. For more information on the tenancy attribute for VPCs, see [Dedicated Instances](#).

## Configure a Compilation Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the `VpcConfig` request parameter of the [CreateCompilationJob](#) API, or provide this information when you create a compilation job in the SageMaker console. SageMaker Neo uses this information to create network interfaces and attach them to your compilation jobs. The network interfaces provide compilation jobs with a network connection within your VPC that is not connected to the internet. They also enable your compilation job to connect to resources in your private VPC. The following is an example of the `VpcConfig` parameter that you include in your call to `CreateCompilationJob`:

```
vpcConfig: { "Subnets": [  
    "subnet-0123456789abcdef0",  
    "subnet-0123456789abcdef1",  
    "subnet-0123456789abcdef2"  
],  
  "SecurityGroupIds": [  
    "sg-0123456789abcdef0"  
  ]  
}
```

## Configure Your Private VPC for SageMaker Compilation

When configuring the private VPC for your SageMaker compilation jobs, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets](#) in the *Amazon VPC User Guide*.

### Topics

- [Ensure That Subnets Have Enough IP Addresses \(p. 2505\)](#)
- [Create an Amazon S3 VPC Endpoint \(p. 2505\)](#)
- [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2506\)](#)
- [Configure Route Tables \(p. 2507\)](#)
- [Configure the VPC Security Group \(p. 2507\)](#)

### Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a compilation job. For more information, see [VPC and Subnet Sizing for IPv4](#) in the *Amazon VPC User Guide*.

### Create an Amazon S3 VPC Endpoint

If you configure your VPC to block access to the internet, SageMaker Neo can't connect to the Amazon S3 buckets that contain your models unless you create a VPC endpoint that allows access. By creating a VPC

endpoint, you allow your SageMaker Neo compilation jobs to access the buckets where you store your data and model artifacts . We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](#).

#### To create an S3 VPC endpoint:

1. Open the Amazon VPC console at <https://console.amazonaws.cn/vpc/>.
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**
3. For **Service Name**, search for **com.amazonaws.region.s3**, where **region** is the name of the region where your VPC resides.
4. Choose the **Gateway** type.
5. For **VPC**, choose the VPC you want to use for this endpoint.
6. For **Configure route tables**, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For **Policy**, choose **Full Access** to allow full access to the S3 service by any user or service within the VPC. Choose **Custom** to restrict access further. For information, see [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2515\)](#).

#### Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see [Using Endpoint Policies for Amazon S3](#). You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see [Using Amazon S3 Bucket Policies](#). The following is a sample customized policy:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Principal": {
                "AWS": "*"
            },
            "Action": "s3:GetObject",
            "Resource": [
                "arn:aws:s3:::your-sample-bucket",
                "arn:aws:s3:::your-sample-bucket/*"
            ],
            "Condition": {
                "StringNotEquals": {
                    "aws:SourceVpce": [
                        "vpce-01234567890123456"
                    ]
                }
            }
        }
    ]
}
```

#### Add Permissions for Compilation Job Running in a Amazon VPC to Custom IAM Policies

The `SageMakerFullAccess` managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker Neo to create an elastic network interface and attach it to compilation job running in a Amazon VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for Amazon VPC access.

```
{"Version": "2012-10-17",
"Statement": [
    {"Effect": "Allow",
        "Action": [
            "ec2:DescribeVpcEndpoints",
            "ec2:DescribeDhcpOptions",
            "ec2:DescribeVpcs",
            "ec2:DescribeSubnets",
            "ec2:DescribeSecurityGroups",
            "ec2:DescribeNetworkInterfaces",
            "ec2:DeleteNetworkInterfacePermission",
            "ec2:DeleteNetworkInterface",
            "ec2:CreateNetworkInterfacePermission",
            "ec2:CreateNetworkInterface",
            "ec2:ModifyNetworkInterfaceAttribute"
        ],
        "Resource": "*"
    }
]
```

For more information about the `SageMakerFullAccess` managed policy, see [AmazonSageMakerFullAccess \(p. 2465\)](#).

## Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, `http://s3-aws-region.amazonaws.com/MyBucket`) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your compilation jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see [Routing for Gateway Endpoints](#) in the *Amazon VPC User Guide*.

## Configure the VPC Security Group

In your security group for the compilation job, you must allow outbound communication to your Amazon S3 Amazon VPC endpoints and the subnet CIDR ranges used for the compilation job. For information, see [Security Group Rules](#) and [Control access to services with Amazon VPC endpoints](#).

# Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC

SageMaker runs processing jobs in an Amazon Virtual Private Cloud by default. However, processing containers access Amazon resources—such as the Amazon S3 buckets where you store data—over the internet.

To control access to your data and processing containers, we recommend that you create a private VPC and configure it so that they aren't accessible over the internet. For information about creating and configuring a VPC, see [Getting Started With Amazon VPC](#) in the *Amazon VPC User Guide*. Using a VPC helps to protect your processing containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your processing containers by using VPC flow logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

You specify your private VPC configuration when you create processing jobs by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates *elastic network interfaces* that are associated with your security groups in one of the subnets. Network interfaces allow your processing containers to connect to resources in your VPC. For information about network interfaces, see [Elastic Network Interfaces](#) in the *Amazon VPC User Guide*.

## Configure a Processing Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the `NetworkConfig.VpcConfig` request parameter of the [CreateProcessingJob](#) API, or provide this information when you create a processing job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your processing containers. The network interfaces provide your processing containers with a network connection within your VPC that is not connected to the internet. They also enable your processing job to connect to resources in your private VPC.

The following is an example of the `VpcConfig` parameter that you include in your call to `CreateProcessingJob`:

```
VpcConfig: {  
    "Subnets": [  
        "subnet-0123456789abcdef0",  
        "subnet-0123456789abcdef1",  
        "subnet-0123456789abcdef2"  
    ],  
    "SecurityGroupIds": [  
        "sg-0123456789abcdef0"  
    ]  
}
```

## Configure Your Private VPC for SageMaker Processing

When configuring the private VPC for your SageMaker processing jobs, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets](#) in the *Amazon VPC User Guide*.

### Topics

- [Ensure That Subnets Have Enough IP Addresses \(p. 2508\)](#)
- [Create an Amazon S3 VPC Endpoint \(p. 2508\)](#)
- [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2509\)](#)
- [Configure Route Tables \(p. 2509\)](#)
- [Configure the VPC Security Group \(p. 2510\)](#)
- [Connect to Resources Outside Your VPC \(p. 2510\)](#)

### Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a processing job. For more information, see [VPC and Subnet Sizing for IPv4](#) in the *Amazon VPC User Guide*.

### Create an Amazon S3 VPC Endpoint

If you configure your VPC so that processing containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your processing containers to access the buckets where you store your data. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](#).

#### To create an S3 VPC endpoint:

1. Open the Amazon VPC console at <https://console.amazonaws.cn/vpc/>.
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**
3. For **Service Name**, choose **com.amazonaws.*region*.s3**, where *region* is the name of the region where your VPC resides.

4. For **VPC**, choose the VPC you want to use for this endpoint.
5. For **Configure route tables**, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For **Policy**, choose **Full Access** to allow full access to the S3 service by any user or service within the VPC. Choose **Custom** to restrict access further. For information, see [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2509\)](#).

## Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see [Using Endpoint Policies for Amazon S3](#). You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see [Using Amazon S3 Bucket Policies](#).

### Restrict Package Installation on the Processing Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the processing container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{  
    "Statement": [  
        {  
            "Sid": "AmazonLinuxAMIRRepositoryAccess",  
            "Principal": "*",  
            "Action": [  
                "s3:GetObject"  
            ],  
            "Effect": "Deny",  
            "Resource": [  
                "arn:aws:s3:::packages.*.amazonaws.com/*",  
                "arn:aws:s3:::repo.*.amazonaws.com/*"  
            ]  
        }  
    ]  
}  
  
{  
    "Statement": [  
        { "Sid": "AmazonLinux2AMIRRepositoryAccess",  
          "Principal": "*",  
          "Action": [  
              "s3:GetObject"  
          ],  
          "Effect": "Deny",  
          "Resource": [  
              "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"  
          ]  
        }  
    ]  
}
```

## Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, `http://s3-aws-region.amazonaws.com/MyBucket`) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your processing jobs resolve by

configuring the endpoint route tables. For information about VPC endpoint route tables, see [Routing for Gateway Endpoints](#) in the *Amazon VPC User Guide*.

## Configure the VPC Security Group

In distributed processing, you must allow communication between the different containers in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see [Security Group Rules](#).

## Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, processing jobs that use that VPC do not have access to resources outside your VPC. If your processing job needs access to resources outside your VPC, provide access with one of the following options:

- If your processing job needs access to an Amazon service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see [VPC Endpoints](#) in the *Amazon VPC User Guide*. For information about creating an interface VPC endpoint, see [Interface VPC Endpoints \(Amazon PrivateLink\)](#) in the *Amazon VPC User Guide*.
- If your processing job needs access to an Amazon service that doesn't support interface VPC endpoints or to a resource outside of Amazon, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see [Scenario 2: VPC with Public and Private Subnets \(NAT\)](#) in the *Amazon Virtual Private Cloud User Guide*.

## Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC

SageMaker hosts models in an Amazon Virtual Private Cloud by default. However, models access Amazon resources—such as the Amazon S3 buckets where you store training data and model artifacts—over the internet.

To avoid making your data and model containers accessible over the internet, we recommend that you create a private VPC and configure it to control access to them. For information about creating and configuring a VPC, see [Getting Started With Amazon VPC](#) in the *Amazon VPC User Guide*. Using a VPC helps to protect your training containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your training containers by using VPC flow logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

You specify your private VPC configuration when you create a model by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates *elastic network interfaces* that are associated with your security groups in one of the subnets. Network interfaces allow your model containers to connect to resources in your VPC. For information about network interfaces, see [Elastic Network Interfaces](#) in the *Amazon VPC User Guide*.

## Configure a Model for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the `vpcConfig` request parameter of the [CreateModel](#) API, or provide this information when you create a model in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your model to connect to resources in your private VPC.

### Note

You must create at least two subnets in different availability zones in your private VPC, even if you have only one hosting instance.

The following is an example of the `VpcConfig` parameter that you include in your call to `CreateModel`:

```
vpcConfig: {  
    "Subnets": [  
        "subnet-0123456789abcdef0",  
        "subnet-0123456789abcdef1",  
        "subnet-0123456789abcdef2"  
    ],  
    "SecurityGroupIds": [  
        "sg-0123456789abcdef0"  
    ]  
}
```

## Configure Your Private VPC for SageMaker Hosting

When configuring the private VPC for your SageMaker models, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets in the Amazon VPC User Guide](#).

### Topics

- [Ensure That Subnets Have Enough IP Addresses \(p. 2511\)](#)
- [Create an Amazon S3 VPC Endpoint \(p. 2511\)](#)
- [Use a Custom Endpoint Policy to Restrict Access to Amazon S3 \(p. 2512\)](#)
- [Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies \(p. 2512\)](#)
- [Configure Route Tables \(p. 2513\)](#)
- [Connect to Resources Outside Your VPC \(p. 2513\)](#)

## Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each model instance. For more information, see [VPC and Subnet Sizing for IPv4](#) in the *Amazon VPC User Guide*.

## Create an Amazon S3 VPC Endpoint

If you configure your VPC so that model containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts. We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](#).

### To create an Amazon S3 VPC endpoint:

1. Open the Amazon VPC console at <https://console.amazonaws.cn/vpc/>.
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**
3. For **Service Name**, choose **com.amazonaws.*region*.s3**, where *region* is the name of the Amazon Region where your VPC resides.
4. For **VPC**, choose the VPC that you want to use for this endpoint.
5. For **Configure route tables**, choose the route tables that the endpoint will use. The VPC service automatically adds a route to each route table that you choose that points Amazon S3 traffic to the new endpoint.
6. For **Policy**, choose **Full Access** to allow full access to the Amazon S3 service by any user or service within the VPC. To restrict access further, choose **Custom**. For more information, see [Use a Custom Endpoint Policy to Restrict Access to Amazon S3 \(p. 2512\)](#).

## Use a Custom Endpoint Policy to Restrict Access to Amazon S3

The default endpoint policy allows full access to Amazon Simple Storage Service (Amazon S3) for any user or service in your VPC. To further restrict access to Amazon S3, create a custom endpoint policy. For more information, see [Using Endpoint Policies for Amazon S3](#).

You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see [Using Amazon S3 Bucket Policies](#).

### Restrict Package Installation on the Model Container with a Custom Endpoint Policy

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the model container. If you don't want users to install packages from those repositories, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{  
    "Statement": [  
        {  
            "Sid": "AmazonLinuxAMIRepositoryAccess",  
            "Principal": "*",  
            "Action": [  
                "s3:GetObject"  
            ],  
            "Effect": "Deny",  
            "Resource": [  
                "arn:aws:s3:::packages.*.amazonaws.com/*",  
                "arn:aws:s3:::repo.*.amazonaws.com/*"  
            ]  
        }  
    ]  
}  
  
{  
    "Statement": [  
        { "Sid": "AmazonLinux2AMIRepositoryAccess",  
          "Principal": "*",  
          "Action": [  
              "s3:GetObject"  
          ],  
          "Effect": "Deny",  
          "Resource": [  
              "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"  
          ]  
        }  
    ]  
}
```

## Add Permissions for Endpoint Access for Containers Running in a VPC to Custom IAM Policies

The `SageMakerFullAccess` managed policy includes the permissions that you need to use models configured for Amazon VPC access with an endpoint. These permissions allow SageMaker to create an elastic network interface and attach it to model containers running in a VPC. If you use your own IAM policy, you must add the following permissions to that policy to use models configured for VPC access.

```
{  
    "Version": "2012-10-17",  
    "Statement": [  
        {  
            "Effect": "Allow",  
            "Action": [  
                "ec2:DescribeNetworkInterfaces",  
                "ec2:CreateNetworkInterface",  
                "ec2:AssociateNetworkInterface",  
                "ec2:DeleteNetworkInterface"  
            ],  
            "Resource": "  
                arn:aws:sagemaker:  
                  
                <region>:  
                <account>:network-interface/  
                <interfaceId>  
            "  
        }  
    ]  
}
```

```
        "Action": [
            "ec2:DescribeVpcEndpoints",
            "ec2:DescribeDhcpOptions",
            "ec2:DescribeVpcs",
            "ec2:DescribeSubnets",
            "ec2:DescribeSecurityGroups",
            "ec2:DescribeNetworkInterfaces",
            "ec2:DeleteNetworkInterfacePermission",
            "ec2:DeleteNetworkInterface",
            "ec2>CreateNetworkInterfacePermission",
            "ec2>CreateNetworkInterface"
        ],
        "Resource": "*"
    }
]
```

For more information about the `SageMakerFullAccess` managed policy, see [AmazonSageMakerFullAccess \(p. 2465\)](#).

## Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, `http://s3-aws-region.amazonaws.com/MyBucket`) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your models resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see [Routing for Gateway Endpoints](#) in the *Amazon VPC User Guide*.

## Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, models that use that VPC do not have access to resources outside your VPC. If your model needs access to resources outside your VPC, provide access with one of the following options:

- If your model needs access to an Amazon service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see [VPC Endpoints](#) in the *Amazon VPC User Guide*. For information about creating an interface VPC endpoint, see [Interface VPC Endpoints \(Amazon PrivateLink\)](#) in the *Amazon VPC User Guide*.
- If your model needs access to an Amazon service that doesn't support interface VPC endpoints or to a resource outside of Amazon, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see [Scenario 2: VPC with Public and Private Subnets \(NAT\)](#) in the *Amazon Virtual Private Cloud User Guide*.

## Give SageMaker Training Jobs Access to Resources in Your Amazon VPC

SageMaker runs training jobs in an Amazon Virtual Private Cloud by default. However, training containers access Amazon resources—such as the Amazon Simple Storage Service (Amazon S3) buckets where you store training data and model artifacts—over the internet.

To control access to your data and training containers, we recommend that you create a private VPC and configure it so that they aren't accessible over the internet. For information about creating and configuring a VPC, see [Getting Started With Amazon VPC](#) in the *Amazon VPC User Guide*. Using a VPC helps to protect your training containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your training containers by using VPC flow logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

You specify your private VPC configuration when you create training jobs by specifying subnets and security groups. When you specify the subnets and security groups, SageMaker creates *elastic network interfaces* that are associated with your security groups in one of the subnets. Network interfaces allow your training containers to connect to resources in your VPC. For information about network interfaces, see [Elastic Network Interfaces](#) in the *Amazon VPC User Guide*.

**Note**

For training jobs, you can configure only subnets with a default tenancy VPC in which your instance runs on shared hardware. For more information on the tenancy attribute for VPCs, see [Dedicated Instances](#).

## Configure a Training Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the `VpcConfig` request parameter of the [CreateTrainingJob](#) API, or provide this information when you create a training job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your training containers. The network interfaces provide your training containers with a network connection within your VPC that is not connected to the internet. They also enable your training job to connect to resources in your private VPC.

The following is an example of the `VpcConfig` parameter that you include in your call to `CreateTrainingJob`:

```
VpcConfig: {  
    "Subnets": [  
        "subnet-0123456789abcdef0",  
        "subnet-0123456789abcdef1",  
        "subnet-0123456789abcdef2"  
    ],  
    "SecurityGroupIds": [  
        "sg-0123456789abcdef0"  
    ]  
}
```

## Configure Your Private VPC for SageMaker Training

When configuring the private VPC for your SageMaker training jobs, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets](#) in the *Amazon VPC User Guide*.

### Topics

- [Ensure That Subnets Have Enough IP Addresses \(p. 2514\)](#)
- [Create an Amazon S3 VPC Endpoint \(p. 2514\)](#)
- [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2515\)](#)
- [Configure Route Tables \(p. 2516\)](#)
- [Configure the VPC Security Group \(p. 2516\)](#)
- [Connect to Resources Outside Your VPC \(p. 2516\)](#)

### Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a training job. For more information, see [VPC and Subnet Sizing for IPv4](#) in the *Amazon VPC User Guide*.

### Create an Amazon S3 VPC Endpoint

If you configure your VPC so that training containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your training data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your training containers to access the buckets where you

store your data and model artifacts . We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](#).

#### To create an S3 VPC endpoint:

1. Open the Amazon VPC console at <https://console.amazonaws.cn/vpc/>.
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**
3. For **Service Name**, search for **com.amazonaws.region.s3**, where **region** is the name of the region where your VPC resides.
4. Choose the **Gateway** type.
5. For **VPC**, choose the VPC you want to use for this endpoint.
6. For **Configure route tables**, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
7. For **Policy**, choose **Full Access** to allow full access to the S3 service by any user or service within the VPC. Choose **Custom** to restrict access further. For information, see [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2515\)](#).

### Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see [Using Endpoint Policies for Amazon S3](#). You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see [Using Amazon S3 Bucket Policies](#).

#### Restrict Package Installation on the Training Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{  
    "Statement": [  
        {  
            "Sid": "AmazonLinuxAMIRRepositoryAccess",  
            "Principal": "*",  
            "Action": [  
                "s3:GetObject"  
            ],  
            "Effect": "Deny",  
            "Resource": [  
                "arn:aws:s3:::packages.*.amazonaws.com/*",  
                "arn:aws:s3:::repo.*.amazonaws.com/*"  
            ]  
        }  
    ]  
}  
  
{  
    "Statement": [  
        { "Sid": "AmazonLinux2AMIRRepositoryAccess",  
          "Principal": "*",  
          "Action": [  
              "s3:GetObject"  
            ],  
          "Effect": "Deny",  
          "Resource": [  
        ]  
    ]  
}
```

```
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
    ]
}
}
```

## Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, `http://s3-aws-region.amazonaws.com/MyBucket`) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your training jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see [Routing for Gateway Endpoints](#) in the *Amazon VPC User Guide*.

## Configure the VPC Security Group

In distributed training, you must allow communication between the different containers in the same training job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see [Security Group Rules](#).

## Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, training jobs that use that VPC do not have access to resources outside your VPC. If your training job needs access to resources outside your VPC, provide access with one of the following options:

- If your training job needs access to an Amazon service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see [VPC Endpoints](#) in the *Amazon VPC User Guide*. For information about creating an interface VPC endpoint, see [Interface VPC Endpoints \(Amazon PrivateLink\)](#) in the *Amazon VPC User Guide*.
- If your training job needs access to an Amazon service that doesn't support interface VPC endpoints or to a resource outside of Amazon, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see [Scenario 2: VPC with Public and Private Subnets \(NAT\)](#) in the *Amazon Virtual Private Cloud User Guide*.

# Give Batch Transform Jobs Access to Resources in Your Amazon VPC

SageMaker runs batch transform jobs in an Amazon Virtual Private Cloud by default. However, model containers access Amazon resources—such as the Amazon S3 buckets where you store your data and model artifacts—over the internet.

To control access to your model containers and data, we recommend that you create a private VPC and configure it so that they aren't accessible over the internet. For information about creating and configuring a VPC, see [Getting Started With Amazon VPC](#) in the *Amazon VPC User Guide*. Using a VPC helps to protect your model containers and data because you can configure your VPC so that it is not connected to the internet. Using a VPC also allows you to monitor all network traffic in and out of your model containers by using VPC flow logs. For more information, see [VPC Flow Logs](#) in the *Amazon VPC User Guide*.

You specify your private VPC configuration when you create a model by specifying subnets and security groups. You then specify the same model when you create a batch transform job. When you specify the subnets and security groups, SageMaker creates *elastic network interfaces* that are associated with your security groups in one of the subnets. Network interfaces allow your model containers to connect to resources in your VPC. For information about network interfaces, see [Elastic Network Interfaces](#) in the *Amazon VPC User Guide*.

## Configure a Batch Transform Job for Amazon VPC Access

To specify subnets and security groups in your private VPC, use the `VpcConfig` request parameter of the [CreateModel](#) API, or provide this information when you create a model in the SageMaker console. Then specify the same model in the `ModelName` request parameter of the [CreateTransformJob](#) API, or in the **Model name** field when you create a transform job in the SageMaker console. SageMaker uses this information to create network interfaces and attach them to your model containers. The network interfaces provide your model containers with a network connection within your VPC that is not connected to the internet. They also enable your transform job to connect to resources in your private VPC.

The following is an example of the `VpcConfig` parameter that you include in your call to [CreateModel](#):

```
VpcConfig: {  
    "Subnets": [  
        "subnet-0123456789abcdef0",  
        "subnet-0123456789abcdef1",  
        "subnet-0123456789abcdef2"  
    ],  
    "SecurityGroupIds": [  
        "sg-0123456789abcdef0"  
    ]  
}
```

If you are creating a model using the [CreateModel](#) API operation, the IAM execution role that you use to create your model must include the permissions described in [CreateModel API: Execution Role Permissions \(p. 2462\)](#), including the following permissions required for a private VPC.

When creating a model in the console, if you select **Create a new role** in the **Model Settings** section, the [AmazonSageMakerFullAccess](#) policy used to create the role will already contain these permissions. If you select **Enter a custom IAM role ARN** or **Use existing role**, the role ARN that you specify must have an execution policy attached with the following permissions.

```
{  
    "Effect": "Allow",  
    "Action": [  
        "ec2:CreateNetworkInterface",  
        "ec2:CreateNetworkInterfacePermission",  
        "ec2:DeleteNetworkInterface",  
        "ec2:DeleteNetworkInterfacePermission",  
        "ec2:DescribeNetworkInterfaces",  
        "ec2:DescribeVpcs",  
        "ec2:DescribeDhcpOptions",  
        "ec2:DescribeSubnets",  
        "ec2:DescribeSecurityGroups"
```

## Configure Your Private VPC for SageMaker Batch Transform

When configuring the private VPC for your SageMaker batch transform jobs, use the following guidelines. For information about setting up a VPC, see [Working with VPCs and Subnets](#) in the *Amazon VPC User Guide*.

### Topics

- [Ensure That Subnets Have Enough IP Addresses \(p. 2518\)](#)
- [Create an Amazon S3 VPC Endpoint \(p. 2518\)](#)
- [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2518\)](#)
- [Configure Route Tables \(p. 2519\)](#)

- [Configure the VPC Security Group \(p. 2519\)](#)
- [Connect to Resources Outside Your VPC \(p. 2519\)](#)

## Ensure That Subnets Have Enough IP Addresses

Your VPC subnets should have at least two private IP addresses for each instance in a transform job. For more information, see [VPC and Subnet Sizing for IPv4](#) in the *Amazon VPC User Guide*.

## Create an Amazon S3 VPC Endpoint

If you configure your VPC so that model containers don't have access to the internet, they can't connect to the Amazon S3 buckets that contain your data unless you create a VPC endpoint that allows access. By creating a VPC endpoint, you allow your model containers to access the buckets where you store your data and model artifacts . We recommend that you also create a custom policy that allows only requests from your private VPC to access to your S3 buckets. For more information, see [Endpoints for Amazon S3](#).

### To create an S3 VPC endpoint:

1. Open the Amazon VPC console at <https://console.amazonaws.cn/vpc/>.
2. In the navigation pane, choose **Endpoints**, then choose **Create Endpoint**
3. For **Service Name**, choose **com.amazonaws.region.s3**, where **region** is the name of the region where your VPC resides.
4. For **VPC**, choose the VPC you want to use for this endpoint.
5. For **Configure route tables**, select the route tables to be used by the endpoint. The VPC service automatically adds a route to each route table you select that points any S3 traffic to the new endpoint.
6. For **Policy**, choose **Full Access** to allow full access to the S3 service by any user or service within the VPC. Choose **Custom** to restrict access further. For information, see [Use a Custom Endpoint Policy to Restrict Access to S3 \(p. 2518\)](#).

## Use a Custom Endpoint Policy to Restrict Access to S3

The default endpoint policy allows full access to S3 for any user or service in your VPC. To further restrict access to S3, create a custom endpoint policy. For more information, see [Using Endpoint Policies for Amazon S3](#). You can also use a bucket policy to restrict access to your S3 buckets to only traffic that comes from your Amazon VPC. For information, see [Using Amazon S3 Bucket Policies](#).

### Restrict Package Installation on the Model Container

The default endpoint policy allows users to install packages from the Amazon Linux and Amazon Linux 2 repositories on the training container. If you don't want users to install packages from that repository, create a custom endpoint policy that explicitly denies access to the Amazon Linux and Amazon Linux 2 repositories. The following is an example of a policy that denies access to these repositories:

```
{  
    "Statement": [  
        {  
            "Sid": "AmazonLinuxAMIRRepositoryAccess",  
            "Principal": "*",  
            "Action": [  
                "s3:GetObject"  
            ],  
            "Effect": "Deny",  
            "Resource": [  
                "arn:aws:s3:::packages.*.amazonaws.com/*",  
                "arn:aws:s3:::packages.*.amazonaws.com/*/  
            ]  
        }  
    ]  
}
```

```
        "arn:aws:s3:::repo.*.amazonaws.com/*"
    }
}
{
  "Statement": [
    { "Sid": "AmazonLinux2AMIRRepositoryAccess",
      "Principal": "*",
      "Action": [
        "s3:GetObject"
      ],
      "Effect": "Deny",
      "Resource": [
        "arn:aws:s3:::amazonlinux.*.amazonaws.com/*"
      ]
    }
  ]
}
```

## Configure Route Tables

Use default DNS settings for your endpoint route table, so that standard Amazon S3 URLs (for example, `http://s3-aws-region.amazonaws.com/MyBucket`) resolve. If you don't use default DNS settings, ensure that the URLs that you use to specify the locations of the data in your batch transform jobs resolve by configuring the endpoint route tables. For information about VPC endpoint route tables, see [Routing for Gateway Endpoints in the Amazon VPC User Guide](#).

## Configure the VPC Security Group

In distributed batch transform, you must allow communication between the different containers in the same batch transform job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see [Security Group Rules](#).

## Connect to Resources Outside Your VPC

If you configure your VPC so that it doesn't have internet access, batch transform jobs that use that VPC do not have access to resources outside your VPC. If your batch transform job needs access to resources outside your VPC, provide access with one of the following options:

- If your batch transform job needs access to an Amazon service that supports interface VPC endpoints, create an endpoint to connect to that service. For a list of services that support interface endpoints, see [VPC Endpoints](#) in the *Amazon VPC User Guide*. For information about creating an interface VPC endpoint, see [Interface VPC Endpoints \(Amazon PrivateLink\)](#) in the *Amazon VPC User Guide*.
- If your batch transform job needs access to an Amazon service that doesn't support interface VPC endpoints or to a resource outside of Amazon, create a NAT gateway and configure your security groups to allow outbound connections. For information about setting up a NAT gateway for your VPC, see [Scenario 2: VPC with Public and Private Subnets \(NAT\)](#) in the *Amazon Virtual Private Cloud User Guide*.

## Give Amazon SageMaker Clarify Jobs Access to Resources in Your Amazon VPC

An Amazon SageMaker Clarify job is a SageMaker processing job. It is deployed in an Amazon Virtual Private Cloud by default and so needs to have access over the public internet to Amazon resources such as the Amazon S3 buckets where you store data.

To control access to your data and SageMaker Clarify jobs, we recommend that you create a private Amazon VPC and configure it so that your jobs aren't accessible over the public internet. For information about creating and configuring an Amazon VPC for processing jobs, see [Give SageMaker Processing Jobs Access to Resources in Your Amazon VPC](#).

This document explains how to add additional Amazon VPC configurations that meet the pre-requirements for SageMaker Clarify jobs.

### Topics

- [Configure a SageMaker Clarify Job for Amazon VPC Access \(p. 2520\)](#)
- [Configure Your Private Amazon VPC for SageMaker Clarify jobs \(p. 2522\)](#)

## Configure a SageMaker Clarify Job for Amazon VPC Access

You need to specify subnets and security groups when configuring your private Amazon VPC for SageMaker Clarify jobs and to enable the job to get inferences from the SageMaker model when computing post-training bias metrics and feature contributions that help explain model predictions.

### Topics

- [SageMaker Clarify Job Amazon VPC Subnets and Security Groups \(p. 2520\)](#)
- [Configure a Model Amazon VPC for Inference \(p. 2521\)](#)

## SageMaker Clarify Job Amazon VPC Subnets and Security Groups

Subnets and security groups in your private Amazon VPC can be assigned to a SageMaker Clarify job in various ways, depending on how you create the job.

- **SageMaker console:** Provide this information when you create the job in the [SageMaker Dashboard](#). From the **Processing** menu, choose **Processing jobs**, then choose **Create processing job**. Select the **VPC** option in the **Network** panel and provide the subnets and security groups using the dropdown lists. Make sure network isolation option provided in this panel is set to disabled.
- **SageMaker API:** Use the `NetworkConfig.VpcConfig` request parameter of the [CreateProcessingJob](#) API, as shown in the following example:

```
"NetworkConfig": {  
    "VpcConfig": {  
        "Subnets": [  
            "subnet-0123456789abcdef0",  
            "subnet-0123456789abcdef1",  
            "subnet-0123456789abcdef2"  
        ],  
        "SecurityGroupIds": [  
            "sg-0123456789abcdef0"  
        ]  
    }  
}
```

- **SageMaker Python SDK:** Use the `NetworkConfig` parameter of the [SageMakerClarifyProcessor](#) API or [Processor](#) API, as shown in the following example:

```
from sagemaker.network import NetworkConfig  
network_config = NetworkConfig(  
    subnets=[  
        "subnet-0123456789abcdef0",  
        "subnet-0123456789abcdef1",  
        "subnet-0123456789abcdef2",
```

```
],
  security_group_ids=[
    "sg-0123456789abcdef0",
  ],
)
```

SageMaker uses the information to create network interfaces and attach them to the SageMaker Clarify job. The network interfaces provide a SageMaker Clarify job with a network connection within your Amazon VPC that is not connected to the public internet. They also enable the SageMaker Clarify job to connect to resources in your private Amazon VPC.

## Configure a Model Amazon VPC for Inference

In order to compute post-training bias metrics and explainability, the SageMaker Clarify job needs to get inferences from the SageMaker model that is specified by the `model_name` parameter of the [analysis configuration](#) for the SageMaker Clarify processing job. Alternatively, if you use the `SageMakerClarifyProcessor` API in the SageMaker Python SDK, the job needs to get the `model_name` specified by the [ModelConfig](#) class. To accomplish this, the SageMaker Clarify job creates an ephemeral endpoint with the model, known as a *shadow endpoint*, and then applies the Amazon VPC configuration of the model to the shadow endpoint.

### Note

The network isolation option of both the SageMaker Clarify job and the model must be disabled (by default the option is disabled) so that the SageMaker Clarify job can communicate with the shadow endpoint.

To specify subnets and security groups in your private Amazon VPC to the SageMaker model, use the `VpcConfig` request parameter of the [CreateModel](#) API or provide this information when you create the model using the SageMaker dashboard in the console. The following is an example of the `vpcConfig` parameter that you include in your call to `CreateModel`:

```
"VpcConfig": {
  "Subnets": [
    "subnet-0123456789abcdef0",
    "subnet-0123456789abcdef1",
    "subnet-0123456789abcdef2"
  ],
  "SecurityGroupIds": [
    "sg-0123456789abcdef0"
  ]
}
```

You can specify the number of instances of the shadow endpoint to launch with the `initial_instance_count` parameter of the [analysis configuration](#) for the SageMaker Clarify processing job. Alternatively, if you use the `SageMakerClarifyProcessor` API in the SageMaker Python SDK, the job needs to get the `instance_count` specified by the [ModelConfig](#) class.

### Note

Even if you only request one instance when creating the shadow endpoint, you need at least two subnets in the model's [ModelConfig](#) in distinct availability zones. Otherwise the shadow endpoint creation fails with the following error:  
`ClientError: Error hosting endpoint sagemaker-clarify-endpoint-XXX: Failed. Reason: Unable to locate at least 2 availability zone(s) with the requested instance type YYY that overlap with SageMaker subnets.`

If your model requires model files in Amazon S3, then the model Amazon VPC needs to have an Amazon S3 VPC endpoint. For more information about creating and configuring an Amazon VPC for SageMaker models, see [Give SageMaker Hosted Endpoints Access to Resources in Your Amazon VPC \(p. 2510\)](#).

## Configure Your Private Amazon VPC for SageMaker Clarify jobs

In general, you can follow the steps in [Configure Your Private VPC for SageMaker Processing](#) to configure your private Amazon VPC for SageMaker Clarify jobs. Here are some highlights and special requirements for SageMaker Clarify jobs.

### Topics

- [Connect to Resources Outside Your Amazon VPC \(p. 2522\)](#)
- [Configure the Amazon VPC Security Group \(p. 2522\)](#)

### Connect to Resources Outside Your Amazon VPC

If you configure your Amazon VPC so that it does not have public internet access, then some additional setup is required to grant SageMaker Clarify jobs access to resources and services outside of your Amazon VPC. For example, an Amazon S3 VPC Endpoint is required because a SageMaker Clarify job needs to load a dataset from an S3 bucket as well as save the analysis results to an S3 bucket. For more information, see [Create an Amazon S3 VPC Endpoint](#) for the creation guide. In addition, if a SageMaker Clarify job needs to get inferences from the shadow endpoint, then it needs to call several more Amazon services.

- **Create an Amazon SageMaker API service VPC endpoint:** The SageMaker Clarify job needs to call the Amazon SageMaker API service to manipulate the shadow endpoint, or describe a SageMaker model for Amazon VPC validation. You can follow the guidance provided in the [Securing all Amazon SageMaker API calls with Amazon PrivateLink](#) blog to create an Amazon SageMaker API VPC endpoint that allows the SageMaker Clarify job to make the service calls. Note that the service name of Amazon SageMaker API service is `com.amazonaws.region.sagemaker.api`, where `region` is the name of the Region where your Amazon VPC resides.
- **Create an Amazon SageMaker Runtime VPC Endpoint:** The SageMaker Clarify job needs to call the Amazon SageMaker runtime service, which routes the invocations to the shadow endpoint. The setup steps are similar to those for the Amazon SageMaker API service. Note that the service name of Amazon SageMaker Runtime service is `com.amazonaws.region.sagemaker.runtime`, where `region` is the name of the Region where your Amazon VPC resides.

### Configure the Amazon VPC Security Group

SageMaker Clarify jobs support distributed processing when two or more processing instances are specified in one of the following ways:

- **SageMaker console:** The `Instance count` is specified in the **Resource configuration** part of the **Job settings** panel on the [Create processing job](#) page.
- **SageMaker API:** The `InstanceCount` is specified when you create the job with the `CreateProcessingJob` API.
- **SageMaker Python SDK:** The `instance_count` is specified when using the `SageMakerClarifyProcessor` API or the `Processor` API.

In distributed processing, you must allow communication between the different instances in the same processing job. To do that, configure a rule for your security group that allows inbound connections between members of the same security group. For information, see [Security group rules](#).

# Monitor Amazon SageMaker

Monitoring is an important part of maintaining the reliability, availability, and performance of SageMaker and your other Amazon solutions. Amazon provides the following monitoring tools to watch SageMaker, report when something is wrong, and take automatic actions when appropriate:

- *Amazon CloudWatch* monitors your Amazon resources and the applications that you run on Amazon in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For example, you can have CloudWatch track CPU usage or other metrics of your Amazon EC2 instances and automatically launch new instances when needed. For more information, see the [Amazon CloudWatch User Guide](#).
- *Amazon CloudWatch Logs* enables you to monitor, store, and access your log files from EC2 instances, Amazon CloudTrail, and other sources. CloudWatch Logs can monitor information in the log files and notify you when certain thresholds are met. You can also archive your log data in highly durable storage. For more information, see the [Amazon CloudWatch Logs User Guide](#).
- *Amazon CloudTrail* captures API calls and related events made by or on behalf of your Amazon account and delivers the log files to an Amazon S3 bucket that you specify. You can identify which users and accounts called Amazon, the source IP address from which the calls were made, and when the calls occurred. For more information, see the [Amazon CloudTrail User Guide](#).
- *CloudWatch Events* delivers a near real-time stream of system events that describe changes in Amazon resources. Create CloudWatch Events rules react to a status change in a SageMaker training, hyperparameter tuning, or batch transform job

## Topics

- [Monitor Amazon SageMaker with Amazon CloudWatch \(p. 2523\)](#)
- [Log Amazon SageMaker Events with Amazon CloudWatch \(p. 2534\)](#)
- [Log Amazon SageMaker API Calls with Amazon CloudTrail \(p. 2535\)](#)
- [Automating Amazon SageMaker with Amazon EventBridge \(p. 2537\)](#)

## Monitor Amazon SageMaker with Amazon CloudWatch

You can monitor Amazon SageMaker using Amazon CloudWatch, which collects raw data and processes it into readable, near real-time metrics. These statistics are kept for 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing. However, the Amazon CloudWatch console limits the search to metrics that were updated in the last 2 weeks. This limitation ensures that the most current jobs are shown in your namespace. To graph metrics without using a search, specify its exact name in the source view. You can also set alarms that watch for certain thresholds, and send notifications or take actions when those thresholds are met. For more information, see the [Amazon CloudWatch User Guide](#).

### SageMaker Metrics and Dimensions

- [SageMaker Endpoint Invocation Metrics \(p. 2524\)](#)
- [SageMaker Multi-Model Endpoint Metrics \(p. 2525\)](#)
- [SageMaker Jobs and Endpoint Metrics \(p. 2527\)](#)
- [SageMaker Ground Truth Metrics \(p. 2529\)](#)
- [SageMaker Feature Store Metrics \(p. 2531\)](#)

- [SageMaker Pipelines Metrics \(p. 2532\)](#)

## SageMaker Endpoint Invocation Metrics

The AWS/SageMaker namespace includes the following request metrics from calls to [InvokeEndpoint](#).

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see [GetMetricStatistics](#) in the [Amazon CloudWatch API Reference](#).

### Endpoint Invocation Metrics

Metric	Description
<code>Invocation4XXErrors</code>	The number of <code>InvokeEndpoint</code> requests where the model returned a 4xx HTTP response code. For each 4xx response, 1 is sent; otherwise, 0 is sent.  Units: None  Valid statistics: Average, Sum
<code>Invocation5XXErrors</code>	The number of <code>InvokeEndpoint</code> requests where the model returned a 5xx HTTP response code. For each 5xx response, 1 is sent; otherwise, 0 is sent.  Units: None  Valid statistics: Average, Sum
<code>Invocations</code>	The number of <code>InvokeEndpoint</code> requests sent to a model endpoint.  To get the total number of requests sent to a model endpoint, use the Sum statistic.  Units: None  Valid statistics: Sum
<code>InvocationsPerInstance</code>	The number of invocations sent to a model, normalized by <code>InstanceCount</code> in each <code>ProductionVariant</code> . $1/\text{numberOfInstances}$ is sent as the value on each request, where <code>numberOfInstances</code> is the number of active instances for the <code>ProductionVariant</code> behind the endpoint at the time of the request.  Units: None  Valid statistics: Sum
<code>ModelLatency</code>	The interval of time taken by a model to respond as viewed from SageMaker. This interval includes the local communication times taken to send the request and to fetch the response from the container of a model and the time taken to complete the inference in the container.  Units: Microseconds  Valid statistics: Average, Sum, Min, Max, Sample Count
<code>OverheadLatency</code>	The interval of time added to the time taken to respond to a client request by SageMaker overheads. This interval is measured from the time SageMaker receives the request until it returns a response to the client, minus the

Metric	Description
	<p><b>ModelLatency.</b> Overhead latency can vary depending on multiple factors, including request and response payload sizes, request frequency, and authentication/authorization of the request.</p> <p>Units: Microseconds</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>

#### Dimensions for Endpoint Invocation Metrics

Dimension	Description
EndpointName, VariantName	Filters endpoint invocation metrics for a <code>ProductionVariant</code> of the specified endpoint and variant.

## SageMaker Multi-Model Endpoint Metrics

The `AWS/SageMaker` namespace includes the following model loading metrics from calls to `InvokeEndpoint`.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see [GetMetricStatistics](#) in the [Amazon CloudWatch API Reference](#).

#### Multi-Model Endpoint Model Loading Metrics

Metric	Description
<code>ModelLoadingWaitTime</code>	<p>The interval of time that an invocation request has waited for the target model to be downloaded, or loaded, or both in order to perform inference.</p> <p>Units: Microseconds</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>
<code>ModelUnloadingTime</code>	<p>The interval of time that it took to unload the model through the container's <code>UnloadModel</code> API call.</p> <p>Units: Microseconds</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>
<code>ModelDownloadingTime</code>	<p>The interval of time that it took to download the model from Amazon Simple Storage Service (Amazon S3).</p> <p>Units: Microseconds</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>
<code>ModelLoadingTime</code>	<p>The interval of time that it took to load the model through the container's <code>LoadModel</code> API call.</p> <p>Units: Microseconds</p>

Metric	Description
	Valid statistics: Average, Sum, Min, Max, Sample Count
ModelCacheHit	<p>The number of <code>InvokeEndpoint</code> requests sent to the multi-model endpoint for which the model was already loaded.</p> <p>The Average statistic shows the ratio of requests for which the model was already loaded.</p> <p>Units: None</p> <p>Valid statistics: Average, Sum, Sample Count</p>

#### Dimensions for Multi-Model Endpoint Model Loading Metrics

Dimension	Description
EndpointName, VariantName	Filters endpoint invocation metrics for a <code>ProductionVariant</code> of the specified endpoint and variant.

The `/aws/sagemaker/Endpoints` namespaces include the following instance metrics from calls to `InvokeEndpoint`.

Metrics are available at a 1-minute frequency.

For information about how long CloudWatch metrics are retained for, see [GetMetricStatistics](#) in the [Amazon CloudWatch API Reference](#).

#### Multi-Model Endpoint Model Instance Metrics

Metric	Description
LoadedModelCount	<p>The number of models loaded in the containers of the multi-model endpoint. This metric is emitted per instance.</p> <p>The Average statistic with a period of 1 minute tells you the average number of models loaded per instance.</p> <p>The Sum statistic tells you the total number of models loaded across all instances in the endpoint.</p> <p>The models that this metric tracks are not necessarily unique because a model might be loaded in multiple containers at the endpoint.</p> <p>Units: None</p> <p>Valid statistics: Average, Sum, Min, Max, Sample Count</p>

#### Dimensions for Multi-Model Endpoint Model Loading Metrics

Dimension	Description
EndpointName, VariantName	Filters endpoint invocation metrics for a <code>ProductionVariant</code> of the specified endpoint and variant.

## SageMaker Jobs and Endpoint Metrics

The `/aws/sagemaker/ProcessingJobs`, `/aws/sagemaker/TrainingJobs`, `/aws/sagemaker/TransformJobs` and `/aws/sagemaker/Endpoints` namespaces include the following metrics for the training jobs and endpoint instances.

Metrics are available at a 1-minute frequency.

### Processing Job, Training Job, Batch Transform Job, and Endpoint Instance Metrics

Metric	Description
CPUUtilization	<p>The sum of each individual CPU core's utilization. The CPU utilization of each core can range between 0 and 100. For example, if there are four CPUs, <code>CPUUtilization</code> can range from 0% to 400%.</p> <p>For processing jobs, the value is the CPU utilization of the processing container on the instance.</p> <p>For training jobs, the value is the CPU utilization of the algorithm container on the instance.</p> <p>For batch transform jobs, the value is the CPU utilization of the transform container on the instance.</p> <p>For endpoint variants, the value is the sum of the CPU utilization of the primary and supplementary containers on the instance.</p> <p><b>Note</b> For multi-instance, each instance reports CPU utilization metrics. However, the default view in CloudWatch shows the average CPU utilization across all instances.</p> <p>Units: Percent</p>
MemoryUtilization	<p>The percentage of memory that is used by the containers on an instance. This value can range between 0% and 100%.</p> <p>For processing jobs, the value is the memory utilization of the processing container on the instance.</p> <p>For training jobs, the value is the memory utilization of the algorithm container on the instance.</p> <p>For batch transform jobs, the value is the memory utilization of the transform container on the instance.</p> <p>For endpoint variants, the value is the sum of the memory utilization of the primary and supplementary containers on the instance.</p> <p>Units: Percent</p> <p><b>Note</b> For multi-instance, each instance reports memory utilization metrics. However, the default view in CloudWatch shows the average memory utilization across all instances.</p>
GPUUtilization	<p>The percentage of GPU units that are used by the containers on an instance. The value can range between 0 and 100 and is multiplied by the number of GPUs. For example, if there are four GPUs, <code>GPUUtilization</code> can range from 0% to 400%.</p>

Metric	Description
	<p>For processing jobs, the value is the GPU utilization of the processing container on the instance.</p> <p>For training jobs, the value is the GPU utilization of the algorithm container on the instance.</p> <p>For batch transform jobs, the value is the GPU utilization of the transform container on the instance.</p> <p>For endpoint variants, the value is the sum of the GPU utilization of the primary and supplementary containers on the instance.</p> <p><b>Note</b> For multi-instance, each instance reports GPU utilization metrics. However, the default view in CloudWatch shows the average GPU utilization across all instances.</p> <p>Units: Percent</p>
GPUMemoryUtilization	<p>The percentage of GPU memory used by the containers on an instance. The value can range between 0 and 100 and is multiplied by the number of GPUs. For example, if there are four GPUs, GPUMemoryUtilization can range from 0% to 400%.</p> <p>For processing jobs, the value is the GPU memory utilization of the processing container on the instance.</p> <p>For training jobs, the value is the GPU memory utilization of the algorithm container on the instance.</p> <p>For batch transform jobs, the value is the GPU memory utilization of the transform container on the instance.</p> <p>For endpoint variants, the value is the sum of the GPU memory utilization of the primary and supplementary containers on the instance.</p> <p><b>Note</b> For multi-instance, each instance reports GPU memory utilization metrics. However, the default view in CloudWatch shows the average GPU memory utilization across all instances.</p> <p>Units: Percent</p>

Metric	Description
DiskUtilization	<p>The percentage of disk space used by the containers on an instance uses. This value can range between 0% and 100%. This metric is not supported for batch transform jobs.</p> <p>For processing jobs, the value is the disk space utilization of the processing container on the instance.</p> <p>For training jobs, the value is the disk space utilization of the algorithm container on the instance.</p> <p>For endpoint variants, the value is the sum of the disk space utilization of the primary and supplementary containers on the instance.</p> <p>Units: Percent</p> <p><b>Note</b></p> <p>For multi-instance, each instance reports disk utilization metrics. However, the default view in CloudWatch shows the average disk utilization across all instances.</p>

#### Dimensions for Processing Job, Training Job and Batch Transform Job Instance Metrics

Dimension	Description
Host	<p>For processing jobs, the value for this dimension has the format [processing-job-name]/algo-[instance-number-in-cluster]. Use this dimension to filter instance metrics for the specified processing job and instance. This dimension format is present only in the /aws/sagemaker/ProcessingJobs namespace.</p> <p>For training jobs, the value for this dimension has the format [training-job-name]/algo-[instance-number-in-cluster]. Use this dimension to filter instance metrics for the specified training job and instance. This dimension format is present only in the /aws/sagemaker/TrainingJobs namespace.</p> <p>For batch transform jobs, the value for this dimension has the format [transform-job-name]/[instance-id]. Use this dimension to filter instance metrics for the specified batch transform job and instance. This dimension format is present only in the /aws/sagemaker/TransformJobs namespace.</p>

## SageMaker Ground Truth Metrics

### Ground Truth Metrics

Metric	Description
ActiveWorkers	A single active worker on a private work team submitted, released, or declined a task. To get the total number of active workers, use the Sum statistic. Ground Truth attempts to deliver each individual ActiveWorkers event once. If this delivery is unsuccessful, this metric may not report the total number of active workers

Metric	Description
	Units: None Valid statistics: Sum, Sample Count
DatasetObjectsAutoAnnotated	<b>The number</b> of dataset objects auto-annotated in a labeling job. This metric is only emitted when automated labeling is enabled. To view the labeling job progress, use the Max metric. Units: None Valid statistics: Max
DatasetObjectsHumanAnnotated	<b>The number</b> of dataset objects annotated by a human in a labeling job. To view the labeling job progress, use the Max metric. Units: None Valid statistics: Max
DatasetObjectsLabelingFailed	<b>The number</b> of dataset objects that failed labeling in a labeling job. To view the labeling job progress, use the Max metric. Units: None Valid statistics: Max
JobsFailed	A single labeling job failed. To get the total number of labeling jobs that failed, use the Sum statistic. Units: None Valid statistics: Sum, Sample Count
JobsSucceeded	A single labeling job succeeded. To get the total number of labeling jobs that succeeded, use the Sum statistic. Units: None Valid statistics: Sum, Sample Count
JobsStopped	A single labeling job was stopped. To get the total number of labeling jobs that were stopped, use the Sum statistic. Units: None Valid statistics: Sum, Sample Count
TasksAccepted	A single task was accepted by a worker. To get the total number of tasks accepted by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TaskAccepted event once. If this delivery is unsuccessful, this metric may not report the total number of tasks accepted. Units: None Valid statistics: Sum, Sample Count

Metric	Description
TasksDeclined	<p>A single task was declined by a worker. To get the total number of tasks declined by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TasksDeclined event once. If this delivery is unsuccessful, this metric may not report the total number of tasks declined.</p> <p>Units: None</p> <p>Valid Statistics: Sum, Sample Count</p>
TasksReturned	<p>A single task was returned. To get the total number of tasks returned, use the Sum statistic. Ground Truth attempts to deliver each individual TasksReturned event once. If this delivery is unsuccessful, this metric may not report the total number of tasks returned.</p> <p>Units: None</p> <p>Valid statistics: Sum, Sample Count</p>
TasksSubmitted	<p>A single task was submitted/completed by a private worker. To get the total number of tasks submitted by workers, use the Sum statistic. Ground Truth attempts to deliver each individual TasksSubmitted event once. If this delivery is unsuccessful, this metric may not report the total number of tasks submitted.</p> <p>Units: None</p> <p>Valid statistics: Sum, Sample Count</p>
TimeSpent	<p>Time spent on a task completed by a private worker. This metric does not include time when a worker paused or took a break. Ground Truth attempts to deliver each TimeSpent event once. If this delivery is unsuccessful, this metric may not report the total amount of time spent.</p> <p>Units: Seconds</p> <p>Valid statistics: Sum, Sample Count</p>
TotalDatasetObjects	<p>The number of dataset objects labeled successfully in a labeling job. To view the labeling job progress, use the Max metric.</p> <p>Units: None</p> <p>Valid statistics: Max</p>

#### Dimensions for Dataset Object Metrics

Dimension	Description
LabelingJobName	Filters dataset object count metrics for a labeling job.

## SageMaker Feature Store Metrics

### Feature Store Metrics

Metric	Description
ConsumedReadRequests	The number of consumed read units over the specified time period. You can retrieve the consumed read units for a feature store runtime operation and its corresponding feature group.  Units: None  Valid statistics: All
ConsumedWriteRequests	The number of consumed write units over the specified time period. You can retrieve the consumed write units for a feature store runtime operation and its corresponding feature group.  Units: None  Valid statistics: All

#### Dimensions for Feature Store Metrics

Dimension	Description
FeatureGroupName, OperationName	Filters feature store runtime operation metrics of the specified feature group.

## SageMaker Pipelines Metrics

The `AWS/Sagemaker/ModelBuildingPipeline` namespace includes the following metrics for pipeline executions.

Two categories of Pipelines execution metrics are available:

- **Execution Metrics across All Pipelines** – Account level pipeline execution metrics (for all pipelines in the current account)
- **Execution Metrics by Pipeline** – Pipeline execution metrics per pipeline

Metrics are available at a 1-minute frequency.

#### Pipelines Execution Metrics

Metric	Description
ExecutionStarted	The number of pipeline executions that started.  Units: Count  Valid statistics: Average, Sum
ExecutionFailed	The number of pipeline executions that failed.  Units: Count  Valid statistics: Average, Sum

Metric	Description
<code>ExecutionSucceeded</code>	The number of pipeline executions that succeeded.  Units: Count  Valid statistics: Average, Sum
<code>ExecutionStopped</code>	The number of pipeline executions that stopped.  Units: Count  Valid statistics: Average, Sum
<code>ExecutionDuration</code>	The duration in milliseconds that the pipeline execution ran.  Units: Milliseconds  Valid statistics: Average, Sum, Min, Max, Sample Count

#### Dimensions for Execution Metrics by Pipeline

Dimension	Description
<code>PipelineName</code>	Filters pipeline execution metrics for a specified pipeline.

#### Pipelines Step Metrics

The `AWS/Sagemaker/ModelBuildingPipeline` namespace includes the following metrics for pipeline steps.

Metrics are available at a 1-minute frequency.

Metric	Description
<code>StepStarted</code>	The number of steps that started.  Units: Count  Valid statistics: Average, Sum
<code>StepFailed</code>	The number of steps that failed.  Units: Count  Valid statistics: Average, Sum
<code>StepSucceeded</code>	The number of steps that succeeded.  Units: Count  Valid statistics: Average, Sum
<code>StepStopped</code>	The number of steps that stopped.  Units: Count  Valid statistics: Average, Sum

Metric	Description
StepDuration	The duration in milliseconds that the step ran. Units: Milliseconds Valid statistics: Average, Sum, Min, Max, Sample Count

#### Dimensions for Pipelines Step Metrics

Dimension	Description
PipelineName, StepName	Filters step metrics for a specified pipeline and step.

## Log Amazon SageMaker Events with Amazon CloudWatch

To help you debug your processing jobs, training jobs, endpoints, transform jobs, notebook instances, and notebook instance lifecycle configurations, anything an algorithm container, a model container, or a notebook instance lifecycle configuration sends to `stdout` or `stderr` is also sent to Amazon CloudWatch Logs. In addition to debugging, you can use these for progress analysis.

### Logs

The following table lists all of the logs provided by Amazon SageMaker.

### Logs

Log Group Name	Log Stream Name
/aws/sagemaker/ Endpoints/ [EndpointName]	[production-variant-name]/[instance-id]
	[production-variant-name]/[instance-id]/[container-name provided in SageMaker model] (For Inference Pipelines)
/aws/sagemaker/ groundtruth/ WorkerActivity	aws/sagemaker/groundtruth/worker-activity/[requester-AWS-Id]-[region]/[timestamp]
/aws/sagemaker/ LabelingJobs	[labeling-job-name]
/aws/sagemaker/ NotebookInstances	[notebook-instance-name]/[LifecycleConfigHook]
	[notebook-instance-name]/jupyter.log
/aws/sagemaker/ ProcessingJobs	[processing-job-name]/[hostname]-[epoch_timestamp]
/aws/sagemaker/ studio	[domain-id]/[user-profile-name]/[app-type]/[app-name]
/aws/sagemaker/ TrainingJobs	[training-job-name]/algo-[instance-number-in-cluster]-[epoch_timestamp]

Log Group Name	Log Stream Name
/aws/sagemaker/ TransformJobs	[transform-job-name]/[instance-id]-[epoch_timestamp]
	[transform-job-name]/[instance-id]-[epoch_timestamp]/data-log
	[transform-job-name]/[instance-id]-[epoch_timestamp]/ [container-name provided in SageMaker model] (For Inference Pipelines)

**Note**

1. The /aws/sagemaker/NotebookInstances/[LifecycleConfigHook] log stream is created when you create a notebook instance with a lifecycle configuration. For more information, see [Customize a Notebook Instance Using a Lifecycle Configuration Script \(p. 124\)](#).
2. For Inference Pipelines, if you don't provide container names, the platform uses \*\*container-1, container-2\*\*, and so on, corresponding to the order provided in the SageMaker model.

For more information about logging events with CloudWatch logging, see [What is Amazon CloudWatch Logs?](#) in the *Amazon CloudWatch User Guide*.

## Log Amazon SageMaker API Calls with Amazon CloudTrail

Amazon SageMaker is integrated with Amazon CloudTrail, a service that provides a record of actions taken by a user, role, or an Amazon service in SageMaker. CloudTrail captures all API calls for SageMaker, with the exception of [InvokeEndpoint](#), as events. The calls captured include calls from the SageMaker console and code calls to the SageMaker API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for SageMaker. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to SageMaker, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the [Amazon CloudTrail User Guide](#).

By default, log data is stored in CloudWatch Logs indefinitely. However, you can configure how long to store log data in a log group. For information, see [Change Log Data Retention in CloudWatch Logs](#) in the *Amazon CloudWatch Logs User Guide*.

## SageMaker Information in CloudTrail

CloudTrail is enabled on your Amazon account when you create the account. When activity occurs in Amazon SageMaker, that activity is recorded in a CloudTrail event along with other Amazon service events in **Event history**. You can view, search, and download recent events in your Amazon account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your Amazon account, including events for Amazon SageMaker, create a trail. A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all Amazon Regions. The trail logs events from all Regions in the Amazon partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other Amazon services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- [Overview for Creating a Trail](#)
- [CloudTrail Supported Services and Integrations](#)
- [Configuring Amazon SNS Notifications for CloudTrail](#)
- [Receiving CloudTrail Log Files from Multiple Regions](#) and [Receiving CloudTrail Log Files from Multiple Accounts](#)

All SageMaker actions, with the exception of [InvokeEndpoint](#), are logged by CloudTrail and are documented in the [Operations](#). For example, calls to the [CreateTrainingJob](#), [CreateEndpoint](#) and [CreateNotebookInstance](#) actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or Amazon Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another Amazon service.

For more information, see the [CloudTrail userIdentity Element](#).

## Operations Performed by Automatic Model Tuning

SageMaker supports logging non-API service events to your CloudTrail log files for automatic model tuning jobs. These events are related to your tuning jobs but, are not the direct result of a customer request to the public Amazon API. For example, when you create a hyperparameter tuning job by calling [CreateHyperParameterTuningJob](#), SageMaker creates training jobs to evaluate various combinations of hyperparameters to find the best result. Similarly, when you call [StopHyperParameterTuningJob](#) to stop a hyperparameter tuning job, SageMaker might stop any of the associated running training jobs. Non-API events for your tuning jobs are logged to CloudTrail to help you improve governance, compliance, and operational and risk auditing of your Amazon account.

Log entries that result from non-API service events have an `eventType` of `AwsServiceEvent` instead of `AwsApiCall`.

## Understanding SageMaker Log File Entries

A trail is a configuration that enables delivery of events as log files to an S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following examples a log entry for the [CreateEndpoint](#) action, which creates an endpoint to deploy a trained model.

```
{
  "eventVersion": "1.05",
  "userIdentity": {
    "type": "IAMUser",
    "principalId": "AIXDAYQEXAMPLEUMLYNGL",
    "arn": "arn:aws:iam::123456789012:user/intern",
    "accountId": "123456789012",
    "accessKeyId": "ASXIAGXAMPLEQULKNXV",
    "userName": "intern"
  },
  "eventTime": "2018-01-02T13:39:06Z",
  "version": "0.0.1"
}
```

```

    "eventSource": "sagemaker.amazonaws.com",
    "eventName": "CreateEndpoint",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "127.0.0.1",
    "userAgent": "USER_AGENT",
    "requestParameters": {
        "endpointName": "ExampleEndpoint",
        "endpointConfigName": "ExampleEndpointConfig"
    },
    "responseElements": {
        "endpointArn": "arn:aws:sagemaker:us-west-2:123456789012:endpoint/exampleendpoint"
    },
    "requestID": "6b1b42b9-EXAMPLE",
    "eventID": "a6f85b21-EXAMPLE",
    "eventType": "AwsApiCall",
    "recipientAccountId": "444455556666"
}

```

The following example is a log entry for the `CreateModel` action, which creates one or more containers to host a previously trained model.

```

{
    "eventVersion": "1.05",
    "userIdentity": {
        "type": "IAMUser",
        "principalId": "AIXDAYQEXAMPLEUMLYNGL",
        "arn": "arn:aws:iam::123456789012:user/intern",
        "accountId": "123456789012",
        "accessKeyId": "ASXIAGXEXAMPLEQUEULKNXV",
        "userName": "intern"
    },
    "eventTime": "2018-01-02T15:23:46Z",
    "eventSource": "sagemaker.amazonaws.com",
    "eventName": "CreateModel",
    "awsRegion": "us-west-2",
    "sourceIPAddress": "127.0.0.1",
    "userAgent": "USER_AGENT",
    "requestParameters": {
        "modelName": "ExampleModel",
        "primaryContainer": {
            "image": "174872318107.dkr.ecr.us-west-2.amazonaws.com/kmeans:latest"
        },
        "executionRoleArn": "arn:aws:iam::123456789012:role/EXAMPLEARN"
    },
    "responseElements": {
        "modelArn": "arn:aws:sagemaker:us-west-2:123456789012:model/barkinghappy2018-01-02t15-23-32-275z-ivrdog"
    },
    "requestID": "417b8dab-EXAMPLE",
    "eventID": "0f2b3e81-EXAMPLE",
    "eventType": "AwsApiCall",
    "recipientAccountId": "444455556666"
}

```

## Automating Amazon SageMaker with Amazon EventBridge

Amazon EventBridge monitors status change events in Amazon SageMaker. EventBridge enables you to automate SageMaker and respond automatically to events such as a training job status change or

endpoint status change. Events from SageMaker are delivered to EventBridge in near real time. You can write simple rules to indicate which events are of interest to you, and what automated actions to take when an event matches a rule. For an example of how to create a rule, see [Schedule a Pipeline with Amazon EventBridge \(p. 2193\)](#).

Some examples of the actions that can be automatically triggered include the following:

- Invoking an Amazon Lambda function
- Invoking Amazon EC2 Run Command
- Relaying the event to Amazon Kinesis Data Streams
- Activating an Amazon Step Functions state machine
- Notifying an Amazon SNS topic or an Amazon SMS queue

#### SageMaker events monitored by EventBridge

- [Training job state change \(p. 2538\)](#)
- [Hyperparameter tuning job state change \(p. 2539\)](#)
- [Transform job state change \(p. 2541\)](#)
- [Endpoint state change \(p. 2541\)](#)
- [Feature group state change \(p. 2542\)](#)
- [Model package state change \(p. 2543\)](#)
- [Pipeline execution state change \(p. 2544\)](#)
- [Pipeline step state change \(p. 2544\)](#)

## Training job state change

Indicates a change in the status of a SageMaker training job.

If the value of `TrainingJobStatus` is `Failed`, the event contains the `FailureReason` field, which provides a description of why the training job failed.

```
{  
    "version": "0",  
    "id": "844e2571-85d4-695f-b930-0153b71dc842",

}

```

}

## Transform job state change

Indicates a change in the status of a SageMaker batch transform job.

If the value of `TransformJobStatus` is `Failed`, the event contains the `FailureReason` field, which provides a description of why the training job failed.

```
{  
    "version": "0",  
    "id": "844e2571-85d4-695f-b930-0153b71dcb42",

        "Tags": {}  
    }  
}
```

## Endpoint state change

Indicates a change in the status of a SageMaker hosted real-time inference endpoint.

The following shows an event with an endpoint in the IN\_SERVICE state.

```
{
    "version": "0",
    "id": "d2921b5a-b0ad-cace-a8e3-0f159d018e06",
    "detail-type": "SageMaker Endpoint State Change",
    "source": "aws.sagemaker",
    "account": "123456789012",
    "time": "1583831889050",
    "region": "us-west-2",
    "resources": [
        "arn:aws:sagemaker:us-west-2:123456789012:endpoint/myendpoint"
    ],
    "detail": {
        "EndpointName": "MyEndpoint",
        "EndpointArn": "arn:aws:sagemaker:us-west-2:123456789012:endpoint/myendpoint",
        "EndpointConfigName": "MyEndpointConfig",
        "ProductionVariants": [
            {
                "DesiredWeight": 1.0,
                "DesiredInstanceCount": 1.0
            }
        ],
        "EndpointStatus": "IN_SERVICE",
        "CreationTime": 1592411992203.0,
        "LastModifiedTime": 1592411994287.0,
        "Tags": {
        }
    }
}
```

## Feature group state change

Indicates a change either in the `FeatureGroupStatus` or the `OfflineStoreStatus` of a SageMaker feature group.

```
{
    "version": "0",
    "id": "93201303-abdb-36a4-1b9b-4c1c3e3671c0",
    "detail-type": "SageMaker Feature Group State Change",

        "pipelineExecutionDescription": "SomeDescription",
        "pipelineArn": "arn:aws:sagemaker:us-east-1:123456789012:pipeline/myPipeline-123",
        "pipelineExecutionArn": "arn:aws:sagemaker:us-east-1:123456789012:pipeline/  
myPipeline-123/execution/p4jn9xou8a8s"
    }
}
```

## Pipeline step state change

Indicates a change in the status of a SageMaker pipeline step.

If there is a cache hit, the event contains the `cacheHitResult` field.

If the value of `currentStepStatus` is `Failed`, the event contains the `failureReason` field, which provides a description of why the step failed.

```
{  
    "version": "0",  
    "id": "ea37ccbb-5e2b-05e9-4073-1daazc940304",

- [PipelineExecutionStatus](#)
- [StepStatus](#)
- [ProcessingJobStatus](#)
- [TrainingJobStatus](#)
- [TransformJobStatus](#)

For more information, see the [Amazon EventBridge User Guide](#).

# Availability Zones

For the Amazon Regions supported by Amazon SageMaker and the Amazon Elastic Compute Cloud (Amazon EC2) instance types that are available in each Region, see [Amazon SageMaker Pricing](#).

Each Amazon Region is divided into sub-regions known as Availability Zones. For a given Region, the Availability Zones in that Region don't always contain the same instance types supported by SageMaker.

Amazon SageMaker Studio is available in all the Amazon Regions supported by Amazon SageMaker except the Amazon GovCloud (US) Regions. In the supported Regions, Studio is available in the same Availability Zones as notebook instances.

For more information, see [Regions and Availability Zones](#) in the *Amazon EC2 User Guide* and [AZ IDs for Your Resources](#) in the *Amazon RAM User Guide*.

The following list provides links to the Availability Zone tables for each Amazon Region supported by SageMaker. Each linked table has a column for each Availability Zone in the Region. For each Availability Zone, the SageMaker components that support each instance type are shown.

## Availability Zone Tables

- [US East \(Ohio\) us-east-2](#)
- [US East \(N. Virginia\) us-east-1](#)
- [US West \(N. California\) us-west-1](#)
- [US West \(Oregon\) us-west-2](#)
- [Asia Pacific \(Hong Kong\) ap-east-1](#)
- [Asia Pacific \(Mumbai\) ap-south-1](#)
- [Asia Pacific \(Seoul\) ap-northeast-2](#)
- [Asia Pacific \(Singapore\) ap-southeast-1](#)
- [Asia Pacific \(Sydney\) ap-southeast-2](#)
- [Asia Pacific \(Tokyo\) ap-northeast-1](#)
- [Canada \(Central\) ca-central-1](#)
- [EU \(Frankfurt\) eu-central-1](#)
- [EU \(Ireland\) eu-west-1](#)
- [EU \(London\) eu-west-2](#)
- [EU \(Paris\) eu-west-3](#)
- [EU \(Stockholm\) eu-north-1](#)
- [Middle East \(Bahrain\) me-south-1](#)
- [South America \(Sao Paulo\) sa-east-1](#)
- [Amazon GovCloud \(US-Gov-West\) us-gov-west-1](#)
- [US ISO East us-iso-east-1](#)

The following Amazon Regions are supported by Amazon SageMaker. Availability Zones tables are not available at this time. For more information, contact Amazon Support.

- [Africa \(Cape Town\) af-south-1](#)
- [EU \(Milan\) eu-south-1](#)

# API Reference Guide for Amazon SageMaker

## Overview

Amazon SageMaker provides APIs, SDKs, and a command line interface that you can use to create and manage notebook instances and train and deploy models.

- [Amazon SageMaker Python SDK](#) (Recommended)
- [Amazon SageMaker API Reference](#)
- [Amazon Augmented AI API Reference](#)
- [Amazon Command Line Interface](#)
- [Amazon SDK for .NET](#)
- [Amazon SDK for C++](#)
- [Amazon SDK for Go](#)
- [Amazon SDK for Java](#)
- [Amazon SDK for JavaScript](#)
- [Amazon SDK for PHP](#)
- [Amazon SDK for Python \(Boto\)](#)
- [Amazon SDK for Ruby](#)
- [Amazon SageMaker Spark](#)

You can also get code examples from the Amazon SageMaker example notebooks GitHub repository.

- [Example notebooks](#)

## Programming Model for Amazon SageMaker

Making API calls directly from code is cumbersome, and requires you to write code to authenticate your requests. Amazon SageMaker provides the following alternatives:

- **Use the SageMaker console**—With the console, you don't write any code. You use the console UI to start model training or deploy a model. The console works well for simple jobs, where you use a built-in training algorithm and you don't need to preprocess training data.
- **Modify the example Jupyter notebooks**—SageMaker provides several Jupyter notebooks that train and deploy models using specific algorithms and datasets. Start with a notebook that has a suitable algorithm and modify it to accommodate your data source and specific needs.
- **Write model training and inference code from scratch**—SageMaker provides multiple Amazon SDK languages (listed in the overview) and the [Amazon SageMaker Python SDK](#), a high-level Python library that you can use in your code to start model training jobs and deploy the resulting models.

- **The SageMaker Python SDK**—This Python library simplifies model training and deployment. In addition to authenticating your requests, the library abstracts platform specifics by providing simple methods and default parameters. For example:
  - To deploy your model, you call only the `deploy()` method. The method creates a SageMaker model artifact, an endpoint configuration, then deploys the model on an endpoint.
  - If you use a custom framework script for model training, you call the `fit()` method. The method creates a .gzip file of your script, uploads it to an Amazon S3 location, and then runs it for model training, and other tasks. For more information, see [Use Machine Learning Frameworks, Python, and R with Amazon SageMaker \(p. 16\)](#).
- **The Amazon SDKs** – The SDKs provide methods that correspond to the SageMaker API (see [Operations](#)). Use the SDKs to programmatically start a model training job and host the model in SageMaker. SDK clients authenticate your requests by using your access keys, so you don't need to write authentication code. They are available in multiple languages and platforms. For more information, see the preceeding list in the overview.

In [Get Started with Amazon SageMaker \(p. 34\)](#), you train and deploy a model using an algorithm provided by SageMaker. That exercise shows how to use both of these libraries. For more information, see [Get Started with Amazon SageMaker \(p. 34\)](#).

- **Integrate SageMaker into your Apache Spark workflow**—SageMaker provides a library for calling its APIs from Apache Spark. With it, you can use SageMaker-based estimators in an Apache Spark pipeline. For more information, see [Use Apache Spark with Amazon SageMaker \(p. 17\)](#).

# Document History for Amazon SageMaker

update-history-change	update-history-description	update-history-date
<a href="#">SageMaker Clarify update 1.0.5</a>	Instance explanations in the CSV file for models with multiple outputs now map correctly to the right columns in v1.0.5. Also, improved numerical handling of models returning 0 and 1 as class probabilities when using logits in Kernel SHAP.	April 22, 2021
<a href="#">New features re:Invent 2020 (p. 2549)</a>	<a href="#">Amazon SageMaker Model Building Pipelines, Automate MLOps with SageMaker Projects, SageMaker Edge Manager, SageMaker Clarify, SageMaker Data Wrangler, SageMaker Feature Store, SageMaker Studio JumpStart, Register and Deploy Models with Model Registry, SageMaker Distributed, Deep Profiling with SageMaker Debugger</a>	December 1, 2020
<a href="#">Studio Notebooks (p. 2549)</a>	<a href="#">SageMaker Studio Notebooks</a>	April 28, 2020
<a href="#">New features re:Invent 2019 (p. 2549)</a>	<a href="#">SageMaker Studio, SageMaker Studio Notebooks (preview), SageMaker Experiments, SageMaker Autopilot, SageMaker Debugger, SageMaker Model Monitor</a>	December 3, 2019
<a href="#">New features re:Invent 2018 (p. 2549)</a>	<a href="#">Amazon SageMaker Ground Truth, Using Elastic Inference in Amazon SageMaker, SageMaker Resources in Amazon Web Services Marketplace, SageMaker Inference Pipelines, SageMaker Neo, Manage Machine Learning Experiments with Search, Use Reinforcement Learning in Amazon SageMaker, Associating Git Repositories with Amazon SageMaker Notebook Instances, Semantic Segmentation, Using Augmented Manifest Files in TrainingJobs</a>	November 28, 2018

<a href="#">Configuring notebook instances (p. 2549)</a>	You can use shell scripts to configure notebook instances when you create or start them. For more information, see <a href="#">Customize a Notebook Instance</a> .	May 1, 2018
<a href="#">Application Auto Scaling support (p. 2549)</a>	Amazon SageMaker now supports Application Auto Scaling for production variants. For information, see <a href="#">Automatically Scaling SageMaker Models</a>	February 28, 2018
<a href="#">TensorFlow 1.5 and MXNet 1.0 support (p. 2549)</a>	Amazon SageMaker Deep Learning containers now support TensorFlow 1.5 and Apache MXNet 1.0.	February 27, 2018
<a href="#">BlazingText algorithm (p. 2549)</a>	Amazon SageMaker now supports the <a href="#">BlazingText</a> algorithm.	January 18, 2018
<a href="#">KMS encryption (p. 2549)</a>	Amazon SageMaker now supports KMS encryption for hosting instances and training model artifacts at rest.	January 17, 2018
<a href="#">CloudTrail support (p. 2549)</a>	Amazon SageMaker now supports <a href="#">logging with Amazon CloudTrail</a> .	January 11, 2018
<a href="#">DeepAR Forecasting algorithm (p. 2549)</a>	Amazon SageMaker now supports the <a href="#">DeepAR</a> algorithm for time series forecasting.	January 8, 2018

# Amazon glossary

For the latest Amazon terminology, see the [Amazon glossary](#) in the *Amazon General Reference*.
